Foreword

This American National Standard, Safety Standard for Cableways, Cranes, Derricks, Hoists, Hooks, Jacks, and Slings, has been developed under the procedures accredited by the American National Standards Institute (ANSI). This Standard had its beginning in December 1916 when an eight-page “Code of Safety Standards for Cranes”, prepared by an ASME Committee on the Protection of Industrial Workers, was presented at the annual meeting of the ASME.

Meetings and discussions regarding safety on cranes, derricks, and hoists were held from 1920 to 1925, involving the ASME Safety Code Correlating Committee, the Association of Iron and Steel Electrical Engineers, the American Museum of Safety, the American Engineering Standards Committee (AESC) (later changed to American Standards Association (ASA), then to the United States of America Standards Institute (USASI), and finally to ANSI), Department of Labor - State of New Jersey, Department of Labor and Industry-State of Pennsylvania, and the Locomotive Crane Manufacturers Association. On June 11, 1925, AESC approved the ASME Safety Code Correlating Committee’s recommendation and authorized the project with the U.S. Department of the Navy, Bureau of Yards and Docks, and ASME as sponsors.

In March 1926, invitations were issued to 50 organizations to appoint representatives to a Sectional Committee. The call for organization of this Sectional Committee was sent out October 2, 1926, and the committee organized November 4, 1926, with 57 members representing 29 national organizations. Commencing June 1, 1927, and using the eight-page code published by ASME in 1916 as a basis, the Sectional Committee developed the “Safety Code for Cranes, Derricks, and Hoists”. The early drafts of this safety code included requirements for “Jacks” but, due to inputs and comments on those drafts, the Sectional Committee decided in 1938 to make the requirements for “Jacks” a separate code. In January 1943, ASA B30.2-1943 was published addressing a multitude of equipment types and in August 1943, ASA B30.1-1943 was published just addressing “Jacks”. Both documents were reaffirmed in 1952 and widely accepted as safety standards.

Due to changes in design, advancement in techniques, and general interest of labor and industry in safety, the Sectional Committee, under the joint sponsorship of ASME and the, Bureau of Yards and Docks (now the Naval Facilities Engineering Command) was reorganized on January 31, 1962, with 39 members representing 27 national organizations. The new committee changed the format of ASA B30.2-1943 so that the multitude of equipment types it addressed could be published in separate volumes that could completely cover the construction, installation, inspection, testing, maintenance and operation of each type of equipment that was included in the scope of ASA B30.2. This format change resulted in the initial publication of B30.3, B30.5, B30.6, B30.11 and B30.16 being designated as “Revisions” of B30.2 with the remainder of the B30 volumes being published as totally new volumes. ASA changed its name to USASI in 1966 and to ANSI in 1969, which resulted in B30 volumes from 1943 to 1968 being designated as either “ASA B30”, “USAS B30” or “ANSI B30” depending on their date of publication.

In 1982, the Committee was reorganized as an Accredited Organization Committee, operating under procedures developed by ASME and accredited by ANSI. This Standard presents a coordinated set of rules that may serve as a guide to government and other regulatory bodies and
municipal authorities responsible for the guarding and inspection of the equipment falling within its scope. The suggestions leading to accident prevention are given both as mandatory and advisory provisions: compliance with both types may be required by employers of their employees.

In case of practical difficulties, new developments, or unnecessary hardship, the administrative or regulatory authority may grant variances from the literal requirements or permit the use of other devices or methods, but only when it is clearly evident that an equivalent degree of protection is thereby secured. To secure uniform application and interpretation of this Standard, administrative or regulatory authorities are urged to consult the B30 Committee, in accordance with the format described in Section IX of the Introduction, before rendering decisions on disputed points.

Safety codes and standards are intended to enhance public safety. Revisions result from committee consideration of factors such as technological advances, new data and changing environmental and industry needs. Revisions do not imply that previous editions were inadequate.

B30.20, Below the Hook Lifting Devices was first published in 1985, new editions were published in 1993, 1999, 2003, and 2006. In the 2010 edition, maintenance was made mandatory, definitions were revised and other changes were made to improve clarity. This 2013 revision added requirements for personnel competence, operating controls marking and inspection, translation of non-English documentation into English and updates to the definition of Duty Cycle to align with revisions made to BTH-1. In addition, responsibilities for Owners and Operators are defined for each piece of equipment. This 2017 edition adds Chapter 6 on Clamps, revisions to product safety labeling, addition of rated load marking requirements for remote operated magnets, expanded and clarified magnet testing requirements, revision to the permanent magnet rating factor, revisions to align with recent changes to the BTH-1, and updates to the operating practices sections to align with revisions to the Standards applicable to the equipment used with BTH lifters.

This Volume of the Standard, which was approved by the B30 Committee and by ASME, was approved by ANSI and designated an American National Standard on TBD.

</table>
Rationale,
Allows, but does not require, manufacturers to designate parts which can be replaced without requiring marking updates similar to repairs. This eliminates burden of updating marking for minor maintenance/repairs.
Revise all chapters to make marking and product safety label requirements consistent.
Vacuum

20-2.2.1 Marking

(b) Identification. All new vacuum lifting devices shall be marked with, but not limited to, the following information:

(1) manufacturer’s name and address
(2) model number
(3) serial number (unique unit identifier)
(4) lifter weight
(5) electrical power requirements (when applicable)
(6) pressure and volume of compressed air required (when applicable)
(7) rated load [as described in para. 20-2.2.1(a)]
(8) ASME BTH-1 Design Category
(9) ASME BTH-1 Service Class

(c) Repaired or Altered Lifters. All repaired or altered vacuum lifting devices shall be provided with identification displaying, but not limited to, the following information:

(1) name and address of the repairer or alterer
(2) date of the repair
(3) repairer’s or alterer’s unit identification
(4) lifter weight (if altered)
(5) electrical power requirements (if altered)
(6) pressure and volume of compressed air required (if altered)
(7) rated load (if altered) [as described in para. 20-2.2.1(a)]
(8) ASME BTH-1 Design Category (if altered)
(9) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(d) Product Safety Labels

(1) Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2007 (4.14), to bring the label to the attention of the operator. The label should include cautionary language to provide danger, warning, or caution, or notice to operators and others against

(a) exceeding the rated load, or lifting loads not specified in the instruction manual
(b) operating a damaged or malfunctioning lifter, or a lifter with missing parts
(c) operating when the vacuum indicator or indicators show inadequate vacuum
(d) operating when the vacuum pads are not spaced for equal loading
(e) incorrect positioning of lifter on load
(f) lifting people
(g) lifting suspended loads over people
(h) leaving suspended loads unattended
(i) removing or obscuring warning labels
(j) operating without having read and understood the operating manual
(k) not staying clear of the suspended load
(l) operating lifter when rated load, lifter weight, or safety markings are missing
(m) lifting loads higher than necessary
(n) making alterations to lifter

Rationale,

Allows, but does not require, manufacturers to designate parts which can be replaced without requiring marking updates similar to repairs. This eliminates burden of updating marking for minor maintenance/repairs.

Revise all chapters to make marking and product safety label requirements consistent.
Close Proximity Magnet
20-3.2.1 Marking

(b) Identification. All new close proximity operated lifting magnets shall be provided with identification displaying, but not limited to, the following information:

(1) manufacturer’s name and address
(2) manufacturer’s model and lifting magnet unit identification number serial number (unique unit identifier)
(3) weight of lifting magnet
(4) duty cycle (when applicable)
(5) the cold current (amps) at 68°F (20°C) (when applicable)
(6) the voltage of the primary power supply or battery (when applicable)
(7) rated load [as described in para. 20-3.2.1(a)]
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class

(c) Repaired or Altered Lifting Magnets. All repaired or altered magnets shall be provided with identification displaying, but not limited to, the following information:

(1) name and address of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) weight of lifting magnet (if altered)
(4) duty cycle (if altered)
(5) the cold current or wattage at 68°F (20°C) (if altered)
(6) the voltage of the primary power supply or battery (if altered)
(7) rated load (if altered) [as described in para. 20-3.2.1(a)]
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(d) Product Safety Labels

(1) Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2007 (4.14), to bring the label to the attention of the operator. The label should include cautionary language to provide danger, warning, or caution, or notice to operators and others against

(a) exceeding the rated load, or lifting loads not specified in the instruction manual
(b) operating a damaged or malfunctioning lifting magnet, or a lifting magnet with missing parts
(c) lifting people
(d) lifting suspended loads over people
(e) leaving suspended loads unattended
(f) removing or obscuring warning labels
(g) operating without having read and understood the operating manual
(h) not staying clear of the suspended load
(i) lifting loads higher than necessary
(j) making alterations to lifting magnet
(k) incorrect positioning of lifter on load
(l) operating lifter at rated load, lifter weight, or safety markings are missing

Rationale,

Allows, but does not require, manufacturers to designate parts which can be replaced without requiring marking updates similar to repairs. This eliminates burden of updating marking for minor maintenance/repairs.
Revise all chapters to make marking and product safety label requirements consistent.
Remote Magnet
20-4.2.1 Marking

(a) Identification. All new remotely operated lifting magnets shall be provided with identification displaying, but not limited to, the following information:

(1) manufacturer’s name and address
(2) manufacturer’s model and lifting magnet unit identification number serial number (unique unit identifier)
(3) weight of lifting magnet
(4) duty cycle (when applicable)
(5) the cold current (amps) at 68°F (20°C) (when applicable)
(6) the voltage of the primary power supply or battery (when applicable)
(7) ASME BTH-1 Design Category B
(8) ASME BTH-1 Service Class

(b) Repaired or Altered Lifting Magnets. All repaired or altered magnets shall be provided with identification displaying, but not limited to, the following information:

(1) name and address of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) weight of lifting magnet (if altered)
(4) duty cycle (if altered)
(5) the cold current or wattage at 68°F (20°C) (if altered)
(6) the voltage of the primary power supply or battery (if altered)
(7) ASME BTH-1 Design Category B
(8) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

Grapple
20-5.2.1 Marking

(a) Identification. All new scrap and material handling grapples shall be marked with, but not limited to, the following information:

(1) manufacturer’s name and address
(2) manufacturer’s serial number or unit identification number (unique unit identifier)
(3) grapple weight
(4) rated voltage (when applicable)
(5) operating hydraulic pressure(s)
(6) rated capacity
(7) rated load
(8 7) ASME BTH-1 Design Category B
(9 8) ASME BTH-1 Service Class

(b) Repaired or Altered Grapples. All repaired or altered scrap and material handling grapples shall be provided with identification displaying, but not limited to, the following information:

(1) name and address of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) grapple weight (if altered)
(4 5) rated voltage (if altered)
(5 4) operating hydraulic pressure(s) (if altered)
(6) rated capacity (if altered)
(7) rated load (if altered)
(8 7) ASME BTH-1 Design Category B
(9 8) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

Rationale,
Allows, but does not require, manufacturers to designate parts which can be replaced without requiring marking updates similar to repairs. This eliminates burden of updating marking for minor maintenance/repairs.
Revise all chapters to make marking and product safety label requirements consistent.
Rationale,
Allows continued use of a lifter with minor damage that does not constitute a hazard, to agree with wording in inspection sections. Update/correct Maintenance section.
20-2.3.7 Repairs
Any indications of damage disclosed by the inspection requirements of Section 20-2.3 shall be corrected according to the procedures outlined in para. 20-2.3.9 before operation of the vacuum lifter is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-2.3.9 Maintenance
(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the vacuum lifting device manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the vacuum lifting device application and operations.

(b) Maintenance Procedure
(1) Before adjustments and repairs are started on a vacuum lifting device, the following precautions shall be taken:
   (a) Locate the vacuum lifting device where it will cause the least interference with other operations in the area.
   (b) All sources of power shall be disconnected, locked out, and tagged “Out of Service.”

(2) Only qualified designated personnel shall perform adjustments, repairs, and tests when required.
   (a) Provisions should be made for qualified designated persons to work on energized equipment when adjustments and tests are required.

(b) Lubrication. All moving parts of the vacuum lifting device for which lubrication is specified should be regularly lubricated. The manufacturer’s recommendations as to points and frequency of lubrication, maintenance of lubrication levels, and types of lubricant should be used.

(c) Adjustments shall be maintained to assure correct functioning of components.

(d) Repairs or replacements shall be made as needed.

(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.

(4) After adjustments and repairs have been made, the vacuum lifting device shall not be returned to service until it has been inspected according to para. 20-2.3.4.

(5) Dated records of repairs and replacements should be made.

(6) Adjustments and Repairs. Any hazardous conditions disclosed by the inspection requirements of para. 20-2.3.1 shall be corrected before normal operation of the vacuum lifting device is resumed. Adjustments and repairs shall be done by, or under the direction of, or by a qualified person.
   (a) Adjustments shall be maintained to assure correct functioning of components.
   (b) Repairs or replacements shall be made as needed.

Rationale,
Allows continued used of a lifter with minor damage that does not constitute a hazard, to agree with wording in inspection sections. Update/correct Maintenance section.
20-3.3.7 Repairs
Any indications of damage disclosed by the inspection requirements of Section 20-3.3 shall be corrected according to the procedures outlined in para. 20-3.3.9 before operation of the lifting magnet is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-3.3.9 Maintenance
(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the lifting magnet manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the lifting magnet application and operations.
(b) Maintenance Procedure
   (1) Before adjustment and repairs are started on a lifting magnet or its controls, the following precautions shall be taken:
      (a) All sources of lifting magnet power shall be disconnected, locked out, and tagged “Out of Service.”
      (b) A lifting magnet removed for repair shall be tagged “Out of Service.”
   (2) Only qualified designated personnel shall work on equipment when adjustments, repairs and tests are required.
   (3) Replacement parts shall be at least equal to the original manufacturer’s specifications.
   (4) After adjustments and repairs have been made, the lifting magnet shall not be returned to service until it has been inspected according to para. 20-3.3.4.
   (5) Dated records of repairs and replacements should be made.
(6) Adjustments and Repairs. Any hazardous conditions disclosed by the inspection requirements of para. 20-3.3.1 shall be corrected before normal operation of the lifting magnet is resumed. Adjustments and repairs shall be done by, or under the direction of, or by, a qualified person.
20-4.3.6 Repairs

Any indications of damage disclosed by the inspection requirements of Section 20-4.3 shall be corrected according to the procedures outlined in para. 20-4.3.8 before operation of the lifting magnet is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-4.3.8 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the lifting magnet manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the lifting magnet application and operations.

(b) Maintenance Procedure

(1) Before adjustments and repairs are started on a lifting magnet or its controls, the following precautions shall be taken:

(a) All sources of lifting magnet power shall be disconnected, locked out, and tagged “Out of Service.”

(b) A lifting magnet removed from service for repair shall be tagged “Out of Service.”

(2) Only qualified designated personnel shall work on equipment when maintenance, repairs and tests are required.

(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.

(4) After adjustments and repairs have been made, the lifting magnet shall not be returned to service until it has been inspected according to para. 20-4.3.3.

(5) Dated records of repairs and replacements should be made.

(6) Adjustments and Repairs. Any hazardous condition disclosed by the inspection requirements of para. 20-4.3.1 shall be corrected before normal operation of the lifting magnet is resumed. Adjustments and repairs shall be done by, or under the direction of, or by, a qualified person.

Rationale,

Allows continued used of a lifter with minor damage that does not constitute a hazard, to agree with wording in inspection sections. Update/correct Maintenance section.
20-5.3.6 Repairs

Any indications of damage disclosed by the inspection requirements of Section 20-5.3 shall be corrected according to the procedures outlined in para. 20-5.3.8 before normal operation of the grapple is resumed, **unless a qualified person determines the damage does not constitute a hazard**. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-5.3.8 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the grapple manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the grapple application and operations.

(b) Maintenance Procedure

(1) Before maintenance is started on a grapple or its controls, the following precautions shall be taken:

(a) all sources of grapple power shall be disconnected, locked out, and tagged “Out of Service”

(b) hydraulic pressure shall be relieved from all circuits before loosening or removing hydraulic components

(c) a grapple removed from service for repair shall be tagged “Out of Service”

(2) Only qualified designated personnel shall perform maintenance, repairs and tests when required. All moving parts of the grapple for which lubrication is specified should be regularly lubricated. The manufacturer’s recommendations as to the points and frequency of lubrication, and types of lubricant, should be used.

(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.

(4) After adjustments and repairs have been made, the grapple shall not be returned to service until it has been inspected according to para. 20-5.3.3.

(5) Dated records of repairs and replacements should be made.

(6) Any hazardous condition disclosed by the inspection requirements of paras. 20-5.3.2 and 20-5.3.3 shall be corrected before operation of the grapple is resumed. Adjustments and repairs shall be done by, or under the direction of, or by, a qualified person.

Reference information

(frequent and periodic inspection wording for all chapters are similar)

20-1.3.3 Frequent Inspection

Items such as the following shall be inspected for damage at intervals as defined in para. 20-1.3.1(b)(2), including observations during operation for any indications of damage that might appear between inspections. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. For all lifters, inspect:

Rationale,

Allows continued used of a lifter with minor damage that does not constitute a hazard, to agree with wording in inspection sections. Update/correct Maintenance section.
20-1.3.9 Maintenance
   (a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the lifter manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the lifter application and operations.
   (b) Maintenance Procedure
       (1) Before adjustments and repairs are started on a lifter, the following precautions shall be taken:
           (a) All sources of power shall be disconnected, locked out, and tagged “Out of Service.”
           (b) A lifter removed from service for repair shall be tagged “Out of Service.”
           (c) Relieve fluid pressure from all circuits before loosening or removing fluid power components.

20-2.3.9 Maintenance
   (a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the vacuum lifting device manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the vacuum lifting device application and operations.
   (b) Maintenance Procedure
       (1) Before adjustments and repairs are started on a vacuum lifting device, the following precautions shall be taken:
           (a) Locate the vacuum lifting device where it will cause the least interference with other operations in the area.
           (b) All sources of power shall be disconnected, locked out, and tagged “Out of Service.”
           (c) Relieve fluid pressure from all circuits before loosening or removing fluid power components.

20-3.3.9 Maintenance
   (a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the lifting magnet manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the lifting magnet application and operations.
   (b) Maintenance Procedure

Reason: improve safety during maintenance and align with BTH-1
Before adjustment and repairs are started on a lifting magnet or its controls, the following precautions shall be taken:

SECTION 20-0.2: DEFINITIONS - GENERAL

rated load: the maximum load for which the equipment is designated by the manufacturer.

SECTION 20-0.7: DEFINITIONS FOR CHAPTER 20-5

abnormal operating conditions: environmental conditions that are unfavorable, harmful, or detrimental to or for the operation of scrap and material handling grapples, such as excessively high or low ambient temperatures, exposure to adverse weather, corrosive fumes, dust-laden or moisture-laden atmospheres, and hazardous locations.

rated capacity: the volume of scrap/material that can be handled with the grapple closed and the tine tips touching. This is to be expressed in cubic yards or cubic meters.

service, heavy: service that involves operation within the rated capacity and load limit that exceeds the limits of normal service, for:

a) One work shift per day working in material that will not crush or deform as the grapple closes
b) Two or more work shifts per day working in material that will crush or deform as the grapple closes.

service, normal: service that involves operation with various weights within the rated load limit, averaging less than 65% of rated load, is limited to operation for a period of one shift or less per day working within the rated load limit in material that will crush or deform as the grapple closes.

service, severe: service that involves normal or heavy service with abnormal operating conditions.

Scrap and Material Handling Grapples
20-5.2.1 Marking

(a) Identification. All new scrap and material handling grapples shall be marked with, but not limited to, the following information:

(1) manufacturer’s name and address
(2) serial number (unique unit identifier)
(3) grapple weight

Reason: Clarify and clean up chapter 5
(4) rated voltage (when applicable)
(5) operating hydraulic pressure(s)
(6) rated capacity
(7a) rated load
(7b) ASME BTH-1 Design Category B
(8a) ASME BTH-1 Service Class

(b) Repaired or Altered Grapples. All repaired or altered scrap and material handling grapples shall be provided with identification displaying, but not limited to, the following information:

(1) name and address of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) grapple weight (if altered)
(4) rated voltage (if altered)
(5) operating hydraulic pressure(s) (if altered)
(6) rated capacity (if altered)
(7a) rated load (if altered)
(7b) ASME BTH-1 Design Category B
(8a) ASME BTH-1 Service Class (if altered)

20-5.4.2 Qualifications
Qualifications for operators of grapples are as follows:

(a) The operator shall be instructed in the use of the grapple by a designated person before operating the grapple. Instructions should include, but not be limited to, the following:

(1) instructions in any special operations or precautions
(2) the manufacturer’s suggested operating procedures
(3) storage of the grapple to protect it from damage
(4) not exceeding the rated load capacity of the grapple nor the material handler by the combined weight of the grapple and the load

(b) The operator shall demonstrate the ability to operate the grapple as instructed before assuming responsibility for using the grapple.
Structural

20-1.4.2 Qualifications
Qualifications for operators of below-the-hook lifting devices are as follows:
(a) The operator shall be instructed in the use of the device by a designated person. Instructions should include, but not be limited to, the following:
   (1) application of the lifter to the load and adjustments, if any, that adapt the lifter to various sizes or kinds of loads
   (2) instructions in any special operations or precautions
   (3) the manufacturer’s suggested operating procedures
   (4) condition of the load itself required for operation of the lifter, such as, but not limited to, balance, surface cleanliness, flatness, bending, and load thickness
   (5) storage of the lifter to protect it from damage
   (6) not exceeding the rated load of the lifting device nor the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and rigging
   (7) the proper attachment of adapters to lifting device for special load handling
(b) The operator shall demonstrate the ability to operate the lifter as instructed before assuming responsibility for using the lifter.
(c) The operator shall demonstrate an understanding of be familiar with standard hand signals when applicable.

Vacuum

20-2.4.2 Qualifications
Qualifications for operators of below-the-hook lifting devices are as follows:
(c) The operator shall demonstrate an understanding of be familiar with standard hand signals when applicable.

Close Proximity Magnet

20-3.4.2 Qualifications
Qualifications for operators of below-the-hook lifting devices are as follows:
(c) The operator shall demonstrate an understanding of be familiar with standard hand signals when applicable.

Remote Magnet

20-4.4.2 Qualifications
Qualifications for operators of below-the-hook lifting devices are as follows:
(c) The operator shall demonstrate an understanding of be familiar with standard hand signals when applicable.

Scrap and Material Handling Grapples

20-5.4.2 Qualifications
Qualifications for operators of below-the-hook lifting devices are as follows:
(c) The operator shall demonstrate an understanding of be familiar with standard hand signals when applicable.

Reason: Request from MC member during reconsideration of Responsibilities addition
SECTION 20-0.6: DEFINITIONS FOR CHAPTER 20-4

load (capacity), rated: the maximum load that the lifting magnet is designated to handle by the manufacturer.

Remote Magnet
20-4.2.1 Marking

(a) Rated Load

(1) General Application Lifting Magnets. The rated load of the lifting magnet shall be legibly marked on the lifting magnet or on a tag attached to the lifting magnet where it is visible. This marking shall refer to the instruction manual for information relating to decreases in rating due to the load surface condition, thickness, percentage of contact with the lifting magnet, temperature, metallurgical composition, and deflection.

(2) Specified Application Lifting Magnets. The rated load of the lifting magnet shall be legibly marked on the lifting magnet or on a tag attached to the lifting magnet where it is visible. This marking shall describe the specific loads for which this rating applies.

(b) Identification. All new remotely operated lifting magnets shall be provided with identification displaying, but not limited to, the following information:

(1) manufacturer’s name and address
(2) serial number (unique unit identifier)
(3) weight of lifting magnet
(4) duty cycle (when applicable)
(5) the cold current (amps) at 68°F (20°C) (when applicable)
(6) the voltage of the primary power supply or battery (when applicable)

(7) rated load. See para. 20-4.2.1(a)
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class

(c) Repaired or Altered Lifting Magnets. All repaired or altered magnets shall be provided with identification displaying, but not limited to, the following information:

(1) name and address of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) weight of lifting magnet (if altered)
(4) duty cycle (if altered)
(5) the cold current or wattage at 68°F (20°C) (if altered)
(6) the voltage of the primary power supply or battery (if altered)

(7) rated load (if altered). See para. 20-4.2.1(a)
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class (if altered)

Rationale: Clarify and clean up chapter 4
This requirement is not applicable to repairs limited to replacement of maintenance parts.

20-4.4.2 Qualifications
Qualifications for operators of below-the-hook lifting devices are as follows:

(a) The operator shall be instructed in the use of the device by a designated person before operating the device. Instructions should include, but not be limited to, the following:

(1) application of the lifter to the load and adjustments, if any, that adapt the lifter to various sizes or kinds of loads

(2) instructions in any special operations or precautions

(3) the manufacturer’s suggested operating procedures

(4) condition of the load required for operation of the lifter, such as, but not limited to, balance, surface cleanliness, flatness, bending, and load thickness

(5) storage of the lifter to protect it from damage

(6) not exceeding the rated load of the lifting device nor the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and rigging

(7) charging of the lifting magnet battery (if required)

(8) the purpose of indicators, meters, or alarms on the lifting magnet

(9) the proper attachment of adapters to lifting device for special load handling

(b) The operator shall demonstrate the ability to operate the lifter as instructed before assuming responsibility for using the lifter.
(d) **Product Safety Labels**

(1) Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011, to bring the label to the attention of the operator. The label should include cautionary language to provide danger, warning, or caution, or notice to operators and others against identifying hazards, methods for accident prevention, and refer to Instruction Manuals for additional information.

- (a) exceeding the rated load, or lifting loads not specified in the instruction manual
- (b) operating a damaged or malfunctioning unit, or a unit with missing parts
- (c) lifting people
- (d) lifting suspended loads over people
- (e) leaving suspended loads unattended
- (f) removing or obscuring warning labels
- (g) operating without having read and understood the operating manual
- (h) not staying clear of the suspended load
- (i) lifting loads higher than necessary
- (j) making alterations to lifter

---

**Vacuum**

20-2.2.1 Marking

(d) **Product Safety Labels**

(1) Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011, to bring the label to the attention of the operator. The label should include cautionary language to provide danger, warning, or caution, or notice to operators and others against identifying hazards, methods for accident prevention, and refer to Instruction Manuals for additional information.

- (a) exceeding the rated load, or lifting loads not specified in the instruction manual
- (b) operating a damaged or malfunctioning lifter, or a lifter with missing parts
- (c) operating when the vacuum indicator or indicators show inadequate vacuum
- (d) operating when the vacuum pads are not spaced for equal loading
- (e) incorrect positioning of lifter on load
- (f) lifting people
- (g) lifting suspended loads over people
- (h) leaving suspended loads unattended
- (i) removing or obscuring warning labels
- (j) operating without having read and understood the operating manual
- (k) not staying clear of the suspended load
- (l) operating lifter when rated load, lifter weight, or safety markings are missing
- (m) lifting loads higher than necessary
- (n) making alterations to lifter

---

Rationale: to better comply with intent of ANSI Z535. “Keep only essential hazard-related information in the product safety sign.”
Close Proximity Magnet

20-3.2.1 Marking

(e) Product Safety Labels

(1) Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011 (4.14), to bring the label to the attention of the operator. The label should include cautionary language to provide danger, warning, or caution, or notice to operators and others against identifying hazards, methods for accident prevention, and refer to Instruction Manuals for additional information.

(a) exceeding the rated load, or lifting loads not specified in the instruction manual

(b) operating a damaged or malfunctioning lifting magnet, or a lifting magnet with missing parts

(c) lifting people

(d) lifting suspended loads over people

(e) leaving suspended loads unattended

(f) removing or obscuring warning labels

(g) operating without having read and understood the operating manual

(h) not staying clear of the suspended load

(i) lifting loads higher than necessary

(j) making alterations to lifting magnet

(k) incorrect positioning of lifter on load

(l) operating lifter when rated load, lifter weight, or safety markings are missing

Rationale: to better comply with intent of ANSI Z535. “Keep only essential hazard-related information in the product safety sign.”
20-1.3.1 Inspection Classification
General
All inspections shall be performed by a designated person. Any deficiencies identified shall be examined and a determination made by a qualified person as to whether they constitute a hazard.

Inspection of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with the inspection requirements in the applicable volume.

(a) Initial Inspection
(1) New and reinstalled lifters shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
(2) Altered or repaired lifters shall be inspected. The inspection may be limited to the provisions affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedure for lifters in regular service is divided into three general classifications based upon the intervals at which inspection should be performed. The intervals, in turn, are dependent upon the critical components of the lifters and the degree of their exposure to wear, deterioration, or malfunction.

The three general classifications are herein designated as every lift, frequent, and periodic, with respective intervals between inspections as defined below.

20-2.3.1 Inspection Classification
Vacuum

(a) Initial Inspection
(1) New and reinstalled vacuum lifters shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
(2) Altered or repaired vacuum lifters shall be inspected. The inspection may be limited to the provisions affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedure for vacuum lifting devices in regular service is divided into three general classifications, based upon the intervals at which inspection should be performed. The intervals, in turn, are dependent upon the nature of the critical components of the vacuum lifting device and the degree of their exposure to wear, deterioration, or malfunction. The three general classifications are designated as every lift, frequent, and periodic, with respective intervals between inspections as defined below.

Close Proximity Magnet

(a) Initial Inspection
(1) New and reinstalled lifting magnets shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
(2) Altered or repaired lifting magnets shall be inspected. The inspection may be limited to the provisions affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedures for lifting magnets in regular service are divided into three general classifications, based upon the intervals at which the inspections shall be performed. The intervals, in turn, are dependent upon the nature of the critical components of the lifting magnet and the degree of their exposure to wear, deterioration, or malfunction. The three general classifications are designated as every lift, frequent, and periodic, with respective intervals between inspections as defined below.

Remote Magnet

(a) Initial Inspection
(1) New and reinstalled lifting magnets shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
(2) Altered or repaired lifting magnets shall be inspected. The inspection may be limited to the provisions affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedures for lifting magnets in regular service are divided into two general classifications, based upon the intervals at which the inspections shall be performed. The intervals, in turn, are dependent upon the nature of the critical components of the lifting magnet and the degree of their exposure to wear, deterioration, or malfunction. The two general classifications are designated as frequent and periodic, with respective intervals between inspections as defined below.

Grapple

(a) Initial Inspection
(1) New and reinstalled grapples shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
(2) Altered or repaired grapples shall be inspected. The inspection may be limited to the provisions affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedures for grapples in regular service are divided into two general classifications, based upon the intervals at which the inspections shall be performed. The intervals, in turn, are dependent upon the nature of the critical components of the grapple and the degree of their exposure to wear, deterioration, or malfunction. The two general classifications are designated as frequent and periodic, with respective intervals between inspections as defined below.
20-3.3.8.2 Load Test

(a) Prior to initial use, all new, altered, or repaired lifting magnets shall be tested by, or under the direction of, a qualified person. The test results and a record shall be recorded confirming the load rating of the lifting magnet.

(1) General Application lifting magnets shall be required to satisfy the General Application Lifting Magnet breakaway force test.

   (a) The rated load for permanent magnet lifters shall be less than 33% of the breakaway force measured in this test.
   (b) The rated load of the lifting for electromagnetic lifters shall be less than 50% of the rated breakaway force measured in this test.

(2) Specified Application lifting magnets shall be required to satisfy the Specified Application Lifting Magnet breakaway force test.

   (a) The specified application rated load for permanent magnet lifters shall be less than 33% of the breakaway force measured in this test.
   (b) The rated load for electromagnet lifters shall be less than 50% of the application breakaway force measured in this test.

(b) The General Application Lifting Magnet breakaway force test shall establish the force required to vertically remove the lifting magnet from a low carbon, rolled steel plate of the minimum thickness stated by the lifting magnet manufacturer. The portion of this plate that is in contact with the lifting magnet shall have a surface finish of not exceed 125 µin. (3.2 x 10⁻⁴ mm) or better finish, and be flat within 0.002 in./ft (0.05 mm/m), without exceeding 0.005 in. (0.127 mm) total. The full operating face of the lifting magnet shall be in contact with the steel plate, which shall be between 60°F (15°C) and 120°F (50°C). Battery operated electromagnets and externally powered electromagnets shall be operated at the manufacturer’s recommended voltage and current levels.

(c) The Specified Application Lifting Magnet breakaway force test shall establish the application breakaway forces of the lifting magnet under the variety of loading conditions for which the lifting magnet is specified. The details of this test should be supplied by the manufacturer of the lifting magnet.

(d) Battery operated electromagnets and externally powered electromagnets shall be tested at the manufacturer’s recommended voltage and current levels.

(d) Altered or repaired lifting magnets shall be tested by, or under the direction of, a qualified person. This test for altered or repaired lifting magnets may be limited to the provisions affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

Rationale: Incorporate MC direction on testing values, miscellaneous clean up items
20-4.3.7 Testing

(a) Prior to initial use, all new, altered or repaired and reinstalled lifting magnets shall be tested by, or under the direction of, a qualified person prior to initial use, to verify compliance with applicable provisions of this Volume, including, but not limited to, the following:

1. A visual inspection to verify that the lifting magnet contains no visible indications of hazardous conditions
2. A check for proper operation of all electrical equipment contained in para. 20-4.2.2

(b) Altered or repaired lifting magnets shall be tested by, or under the direction of, a qualified person. The test for altered or repaired lifting magnets may be limited to the provisions affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(c) All indicator lights, gauges, horns, bells, alarms, pointers, and other warning devices shall be tested.

(d) Dated reports of all operational tests shall be filed.

Rationale: Incorporate MC direction on testing values, miscellaneous clean up items
SECTION 20-2.1: SCOPE
Chapter 20-2 applies to the marking, construction, installation, inspection, testing, maintenance, and operation of vacuum below-the-hook lifting devices. The provisions of Chapter 20-2 apply to all power operated and mechanically operated vacuum lifting and manipulating devices, except those vacuum lifting devices handling porous materials that require special design considerations.

20-2.2.2 Construction
(a) Vacuum Pad Rating. The ultimate pad capacity (UPC) shall be determined by the formulas provided in ASME BTH-1. (b) Electrical Equipment. External power supply, electrical equipment, and wiring for below-the-hook lifters shall comply with ANSI/NFPA 70 and ASME BTH-1. (c) Horizontal Surface Lifts. The rated load shall not be greater than 50% of the UPC for horizontal surface lifts. (d) Vertical Surface Lifts. The rated load shall not be greater than 25% of the UPC for vertical surface lifts. (e) Load Type. These factors are for clean, flat, dry, nonporous loads, and shall be increased as required by the surface conditions of materials to be lifted. (f) Vacuum Reserve System. The vacuum lifting device shall incorporate a vacuum reservoir of sufficient size to prevent the vacuum level under the pads from decreasing more than 10% in 4 min with power off on a clean, dry, and nonporous load. The vacuum lifting device shall be designed so that when in operation, all available vacuum reservoirs of the machine shall be channeled to the vacuum pads in use during a “vacuum-power-off” condition. (g) Vacuum Lifter Structural Design. The manufacturer shall verify that vacuum lifting devices are designed by or under the direct supervision of a qualified person. The design shall be in accordance with ASME BTH-1 and shall consider the stresses resulting from the application of rated load plus the weight of the vacuum lifting device. Vacuum lifting devices shall be designed to ASME BTH-1 Design Category B (static strength criteria) and the proper Service Class (fatigue life criteria) selected for its number of load cycles unless a qualified person representing the owner, purchaser, or user of the lifting device determines and can demonstrate that ASME BTH-1 Design Category A is appropriate. Design Category A shall only be designated when the magnitude and variation of loads applied to the vacuum lifter are predictable and do not exceed the rated capacity, where the loading and environmental conditions are accurately defined, service is not severe, and the anticipated number of load cycles does not exceed Service Class 0. (hb) Welding. All welding shall be in accordance with ANSI/AWS D14.1 and ASME BTH-1. (i) Power Disconnects (1) Hoisting equipment using an externally powered vacuum lifter shall have a separate vacuum lifter circuit switch of the enclosed type with provision for locking, flagging, or tagging in the open (off) position. The vacuum lifter disconnect switch shall be connected on the line side (power supply side) of the hoisting equipment disconnect switch. (2) Disconnects are not required on externally powered vacuum lifters operating from a 120 V AC single-phase power source.

Rationale,
Update to eliminate items moved to BTH-1, correct miscellaneous errors.
(c) **Electrical Equipment.** External power supply, electrical equipment, and wiring for below-the-hook lifters shall be in accordance with ASME BTH-1.

(jd) **Alterations.** Vacuum lifters may be altered or rerated, provided such alterations are analyzed and approved by the equipment manufacturer or a qualified person. A rerated lifter or one whose components have been altered shall conform to this para. 20-2.2.2 and be tested according to para. 20-2.3.8. The new rated load shall be displayed in accordance with para. 20-2.1(a).18

(ke) **Slings,** when employed, shall meet the requirements of ASME B30.9.

(Hf) **Hooks,** when employed, shall meet the requirements of ASME B30.10.

(mg) **Rigging hardware,** when employed, shall meet the requirements of ASME B30.26.

Rationale,
Update to eliminate items moved to BTH-1, correct miscellaneous errors.
Chapter 20-6
Clamps

SECTION 20-6.1: SCOPE

Chapter 20-6 applies to the classification, marking, construction, installation, inspection, testing, maintenance, and operation of clamps. For proper function, a clamp relies on a non-vertical force against the surface of the load to generate a vertical lifting force, or a force normal to the surface of the load or anchorage to prevent motion of the clamp relative to the load or anchorage, or both. These forces may be generated by gravity or by screw, cam or similar device. Clamps included in this chapter may be used for attaching loads to a hoist, or for other load handling purposes such as anchoring or positioning. Within Chapter 20-6, the clamps are categorized as follows:

• Supporting clamps (see Figure 20-6.0-1 for examples).
• Friction-type, pressure-gripping clamps (see Figures 20-6.0-2 and 20-6.0-3 for examples.)
• Indentation-type, pressure-gripping clamps (see Figure 20-6.0-4 for examples).
• Anchoring and positioning clamps. Anchoring clamps are used for suspending or attaching detachable rigging hardware. Positioning clamps are used to hold or locate parts during assembly operations (see Figure 20-6.0-5 for examples).
• Hybrid clamps which use a combination of categories above (see Figure 20-6.0-6 for example).

SECTION 20-6.2: MARKING, CONSTRUCTION, AND INSTALLATION

20-6.2.1 Marking

(a) Rated Load. The rated maximum and minimum (if applicable) loads of the clamp shall be legibly marked on its main structure or on a tag attached to its main structure where it is visible. The minimum load (if applicable) shall be defined by the manufacturer or a qualified person.

(b) Identification. Clamps shall be marked with, but not limited to, the following information:

(1) manufacturer’s name and contact information
(2) serial number (unique unit identifier)
(3) clamp weight, if over 100 lb (45 kg)
(4) rated maximum load [as described in para. 20-6.2.1(a)]
(5) rated minimum load (if applicable) [as described in para. 20-6.2.1(a)]
(6) ASME BTH-1 Design Category
(7) ASME BTH-1 Service Class
(8) Clamps that are designed only for anchoring or positioning shall be marked accordingly

(c) Repaired or Altered Clamps. Repaired or altered clamps shall be provided with identification displaying, but not limited to, the following information:

(1) name and contact information of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) clamp weight (if altered)
(4) rated maximum load (if altered) [as described in para. 20-6.2.1(a)]
(5) rated minimum load (if altered) [as described in para. 20-6.2.1(a)]
(6) ASME BTH-1 Design Category (if altered)
(7) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(d) Product Safety Labels

(1) Where size and shape of the clamp allow, clamps shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011, to bring the label to the attention of the operator. The label should include cautionary language identifying hazards, methods for accident prevention, and refer to Instruction Manuals for additional information.
(2) Where size or shape of the clamp prohibits the inclusion of all or any such markings, a label shall be affixed, referring user to consult manufacturer’s instruction manual for product safety information.

20-6.2.2 Construction

The manufacturer shall verify that clamps are designed in accordance with ASME BTH-1.

Clamps shall be designed to ASME BTH-1 Design Category B (static strength criteria) and the proper Service Class (fatigue life criteria) selected for its number of load cycles, unless a qualified person representing the owner, purchaser, or user of the clamp determines that ASME BTH-1 Design Category A is appropriate.

Design Category A shall only be designated when the magnitude and variation of loads applied to the clamp are predictable and where the loading and environmental conditions are accurately defined, where service is not severe, and where the anticipated number of load cycles does not exceed Service Class 0.

(a) Welding. Welding shall be in accordance with ASME BTH-1, 1-4.6.
(b) Guards for Moving Parts. Exposed moving parts, such as, but not limited to, gearing and projecting shafts, that constitute a hazard under normal operating conditions shall be guarded.
(c) Electrical Equipment. External power supply, electrical equipment, and wiring for clamps shall be in accordance with ASME BTH-1.
(d) Alterations. Clamps may be altered or rerated, provided such alterations are analyzed and approved by the equipment manufacturer or a qualified person. A rerated clamp, or one whose components have been altered, shall conform to para. 20-6.2.2 and be tested according to para. 20-6.3.8. The new rated load shall be displayed in accordance with para. 20-6.2.1.
(e) Slings, when employed, shall meet the requirements of ASME B30.9.
(f) Hooks, when employed, shall meet the requirements of ASME B30.10.
(g) Rigging hardware, when employed, shall meet the requirements of ASME B30.26.

20-6.2.3 Installation

(a) The clamp shall be installed in accordance with the manufacturer’s instructions.

SECTION 20-6.3: INSPECTION, TESTING, AND MAINTENANCE

20-6.3.1 Inspection Classification

General. All inspections shall be performed by a designated person. Any deficiencies identified shall be examined and a determination made by a qualified person as to whether they constitute a hazard, and if so, what additional steps need to be taken to address the hazard.

Inspection of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other devices shall comply with the inspection requirements in the applicable volume.

(a) Initial Inspection

(1) New and reinstalled clamps shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.

(2) Altered or repaired clamps shall be inspected. The inspection may be limited to those components affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedure for clamps in regular service is divided into three general classifications based upon the intervals at which inspection should be performed. The intervals, in turn, are dependent upon the
critical components of the clamps and the degree of their exposure to wear or deterioration. The three general classifications are herein designated as every lift, frequent, and periodic, with respective intervals between inspections as defined below.

1. Every Lift Inspection. Visual examination before and during each use of the clamp.
2. Frequent Inspection. Visual examinations with records not required.
   a. Normal service — monthly
   b. Heavy service — weekly to monthly
   c. Severe service — daily to weekly
   d. Special or infrequent service — as recommended by a qualified person before and after each lift
3. Periodic Inspection. Visual inspection making records of apparent external conditions to provide the basis for a continuing evaluation. An external code mark on the clamp is an acceptable identification in lieu of records.
   a. Normal service — yearly
   b. Heavy service — semiannually
   c. Severe service — quarterly
   d. Special or infrequent service — as recommended by a qualified person before the first such lift and as directed by the qualified person for any subsequent lifts

20-6.3.2 Every Lift Inspection

Items such as the following shall be inspected before and/or during every lift for any indication of damage as specifically indicated, including observations during operation for any damage that might occur during the lift:
   a. clamp load contact surface condition
   b. engagement
   c. obvious clamp damage

20-6.3.3 Frequent Inspection

Clamps shall be inspected for damage at intervals as defined in para. 20-6.3.1(b)(2), including observations during operation for any indications of damage that might appear between inspections. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. Conditions such as those listed in para. 20-6.3.7, or any other condition that may constitute a hazard, shall cause the clamp to be removed from service. Clamps shall not be returned to service until approved by a qualified person.

20-6.3.4 Periodic Inspection

Documented inspection of the clamp shall be performed at intervals as defined in para. 20-6.3.1(b)(3), including observations during operation for any indications of damage. If external conditions indicate, disassembly shall be performed for a detailed inspection. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. Conditions such as those listed in para. 20-6.3.7, or any other condition that may result in a hazard, shall cause the clamp to be removed from service. Clamps shall not be returned to service until approved by a qualified person. The inspection and documentation shall be based on the manufacturer’s instructions or para. 20-6.3.7

20-6.3.5 Clamps Not in Regular Use

A clamp that has been idle for a period of 1 mo. to 1 yr. shall be inspected in accordance with para. 20-6.3.3 before being placed in service. A clamp that has been idle for a period of 1 yr. or more shall be inspected in accordance with para. 20-6.3.4 before being returned to service.

20-6.3.6 Inspection Records

Dated inspection reports shall be made on critical items such as those listed in para. 20-6.3.7. Records should be available for each periodic inspection and when the clamp is either altered or repaired.

20-6.3.7 Removal Criteria

A clamp shall be removed from service if conditions (if applicable) such as the following are present (limits established by the manufacturer or qualified person) and shall only be returned to service when approved by a qualified person:
   a. deformation, cracks, or wear
   b. loose or missing guards, fasteners, covers, stops, or nameplates
   c. excessive pitting or corrosion
   d. excessive nicks or gouges
   e. indications of heat damage, including weld spatter or arc strikes
   f. evidence of unauthorized welding or modification
   g. unauthorized replacement components
(h) improper assembly
(i) gripping teeth:
   (i) severely worn
   (ii) broken, chipped, or damaged
   (iii) clogged with foreign material
(j) gripping surfaces
   (i) contamination
   (ii) excessive surface wear
   (iii) lack of integrity of the gripping material
   (iv) lack of bond between gripping material and metal backing
(k) damaged or distorted pins
(l) bail
   (i) severely worn,
   (ii) bent, twisted, distorted, stretched, cracked, or broken
(m) body
   (i) cracked welds
   (ii) bent, twisted, distorted, elongated pin holes, or cracks
(n) damaged, distorted, or worn threads including foreign material on the threads
(o) impaired, seized, or bound cam, linkage, bail movement, or locking lever
(p) deformed, broken or missing spring(s)
(q) broken, worn, or loose cam
(r) other conditions, including visible damage, that cause doubt as to continued safe use

20-6.3.8 Repairs

Damage disclosed by the inspection requirements of Section 20-6.3 shall be corrected according to the procedures outlined in para. 20-6.3.10 before operation of the clamp is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other devices shall comply with repair requirements in the applicable volumes or standards.

20-6.3.9 Testing

20-6.3.9.1 Operational Tests

(a) New clamps shall be tested by a qualified person, or a designated person under the direction of a qualified person, prior to initial use to verify compliance with applicable provisions of this Volume, including, but not limited to, the following:

   (1) Moving Parts. Clamps with moving parts shall be tested to determine that the clamp operates in accordance with manufacturer’s instructions.

   (2) Locking mechanisms. Clamps with manually operated or automatic locking mechanisms shall be tested to determine that the locking mechanism operates in accordance with manufacturer’s instructions.

(b) Altered or repaired clamps shall be tested by a qualified person, or a designated person under the direction of a qualified person. This test may be limited to the components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(c) All indicator lights, gages, horns, bells, alarms, pointers, and other warning devices shall be tested.

(d) Dated reports of all operational tests shall be filed.

20-6.3.9.2 Load Test

(a) Prior to initial use, all new, altered, or repaired clamps should be tested and inspected. If performed, tests shall be done by a qualified person, or a designated person under the direction of the manufacturer or a qualified person and a written report be furnished, confirming the load rating of the clamp. The load rating should not be more than 80% of the maximum load sustained during the test. Test loads shall not be more than 125% of the rated load unless otherwise recommended by the manufacturer. Test reports should be available.

(b) The load test, if made, shall consist of the following operations as a minimum:

   (1) Hoist the test load a sufficient distance to ensure the load is supported by the clamp, or apply the required load if the test is made using a testing machine.

   (2) After the test load is released, visually inspect the clamp for deformation, cracks, or other defects.

(c) Tests of altered or repaired clamps may be limited to the components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer and shall be tested to at least the rated load.

20-6.3.10 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made
by the clamp manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the clamp application and operation.

(b) Maintenance Procedure

(1) Before adjustments and repairs are started on a clamp, the following precautions shall be taken:
   (a) All sources of power shall be disconnected, locked out, and tagged “Out of Service”.
   (b) A clamp removed from service for repair shall be tagged “Out of Service”.
(2) Only designated persons shall perform adjustments, repairs and tests.
(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.
(4) After adjustments and repairs have been made, the clamp shall not be returned to service until it has been inspected according to para. 20-6.3.4.
(5) Dated records of repairs and replacements should be made.
(6) Adjustments and Repairs. Any hazardous conditions disclosed by the inspection of para. 20-6.3.1 shall be corrected before normal operation of the clamp is resumed. Adjustments and repairs shall be done under the direction of, or by, a qualified person.

SECTION 20-6.4: OPERATION

20-6.4.1 Operators
Clamps shall be operated only by trained, designated persons.

20-6.4.2 Qualifications
Qualifications for operators of clamps are as follows:
(a) The operator shall be instructed in the use of the clamp by a designated person. Instructions should include, but not be limited to, the following:
   (1) application of the clamp to the load and material handling device, and adjustments, if any, that adapt the clamp to various sizes or kinds of loads
   (2) instructions in any special operations or precautions
   (3) the manufacturer’s suggested operating procedures
   (4) characteristics of the load itself required for operation of the clamp, such as, but not limited to, balance, surface cleanliness, flatness, rigidity, and thickness
   (5) storage of the clamp to protect it from damage
   (6) not exceeding the rated load of the clamp nor the capacity of the hoisting equipment by the combined weight of the load, the clamp, and rigging
   (7) the proper attachment of adapters to the clamp for special load handling
(b) The operator shall demonstrate the ability to operate and inspect the clamp as instructed before assuming responsibility for using the clamp.
(c) The operator shall be familiar with standard hand signals when applicable.

20-6.4.3 Responsibilities
While the organizational structure of various projects may differ, the following roles are described here for purposes of delineating responsibilities. All responsibilities listed below shall be assigned in the worksite organization. (A single individual may perform one or more of these roles.)

operator: directly controls the clamp’s functions.
owner: has custodial control of a clamp by virtue of lease or ownership. These persons and roles may or may not match the persons and roles associated with the hoisting equipment

20-6.4.3.1 Responsibilities of the Clamp Owner.
The responsibilities of the clamp owner shall include the following:
(a) providing a clamp, and all necessary components specified by the manufacturer, that meets the requirements of Sections 20-6.2 and 20-6.3 as well as specific job requirements.
(b) providing all applicable operating instructions.
(c) providing field assembly, and disassembly (if applicable), operation and maintenance information, and warning decals and placards installed as prescribed by the clamp manufacturer.
(d) establishing an inspection, testing, and maintenance program in accordance with Section 20-6.3.
(e) using designated personnel to perform the required maintenance, repair and inspections.
(f) ensuring that the clamp is in proper operating condition prior to initial use at the worksite by the following:
   (1) verifying that all inspections have been performed as required by Section 20-6.3
   (2) verifying that the clamp has the necessary lifting capacity to perform the proposed lifting operations
in the planned configuration

(g) using operators that meet the requirements of para. 20-6.4.2.

(h) ensuring that all personnel involved in maintenance, repair, assembly, disassembly, and inspection are aware of their responsibilities, assigned duties, and the associated hazards.

(i) determining if additional regulations are applicable to clamp operations.

(j) ensuring that conditions that may adversely affect clamp operations are addressed. Such conditions include, but are not limited to, the following:

(1) wind velocity or gusting winds
(2) precipitation
(3) fog or humidity
(4) extreme temperatures
(5) lighting

(k) addressing safety concerns raised by the operator or other personnel and being responsible if they and a qualified person decide to overrule those concerns and directs clamp operations to continue. (In all cases, the manufacturer’s criteria for safe operation and the requirements of this Volume shall be followed.)

20-6.4.3.2 Responsibilities of Operators. The operator shall be responsible for the following listed items. The operator shall not be responsible for hazards or conditions that are not under his direct control and that adversely affect operation of the clamp. Whenever the operator has doubt as to the safety of lifting operations, the operator shall place the load in a safe condition and stop the lift in a controlled manner. Use of the clamp shall resume only after safety concerns have been addressed or the continuation of clamp usage is directed by the owner and a qualified person.

The operator’s responsibilities shall include the following:

(a) reviewing the requirements for the clamp with the owner before operations.

(b) knowing what types of site conditions could adversely affect the operation of the clamp and consulting with the owner concerning the possible presence of those conditions.

(c) understanding and applying the information contained in the clamp manufacturer’s operating manual.

(d) understanding the clamp’s functions and limitations as well as its particular operating characteristics.

(e) ensuring an inspection is performed prior to every lift as specified in para. 20-6.3.2.

(f) promptly reporting the need for any adjustments or repairs to a designated person.

(g) following applicable lock out/tag out procedures.

(h) not using the clamp when physically or mentally unfit.

(i) ensuring that all personnel are in the clear before initiating the lift.

(j) not engaging in any practice that will divert his attention while using the clamp.

(k) inspecting the clamp for proper function before use.

(l) using the clamp in a smooth and controlled manner.

(m) knowing and following the procedures specified by the manufacturer or approved by a qualified person, concerning attachment of the clamp.

(n) considering all factors known that might affect the clamp capacity and informing the owner of the need to make appropriate adjustments.

(o) responding only to instructions from designated persons. However, the operator shall obey a stop order at all times, no matter who gives it.

(p) not making alterations or modifications to the clamp.

20-6.4.4 Clamp Operating Practices

(a) Selection of the Clamp and Proper Setup

(1) Follow manufacturer’s procedures to prevent load disengagement

(2) Verify load meets or exceeds the minimum load required for proper clamp function.

(3) Use proper clamp for material hardness, material type, surface conditions, etc.

(4) Do not Lift multiple or sagging plates unless approved by the manufacturer.

(5) Assure all moving clamp components move freely without binding

(6) Do not use two or more vertical clamps on opposite ends of a plate to lift the plate in the horizontal position unless approved by the manufacturer.

(7) When locks are provided on the clamp they shall be used.

(8) A clamp shall only be used within its thickness range
(9) Reduce the rated load as required by the manufacturer, for lifts other than a straight lift.

(b) Clamps shall be operated only by the following qualified personnel:
   
   (1) designated persons
   
   (2) trainees under the supervision of a designated person, the number of trainees permitted to be supervised by a single designated person, the physical location of the designated person while supervising, and the type of communication required between the designated person and the trainee shall be determined by a qualified person
   
   (3) maintenance and test personnel, when it is necessary in the performance of their duties
   
   (4) inspectors

   (c) Ensure the weight of the load and its approximate center of gravity have been obtained, provided or calculated.

   (d) The clamp shall not be loaded in excess of its rated load or handle any load for which it is not designed.

   (e) Properly attaching the lifting device to the hook, shackle, or other load handling device.

   (f) Clamps and the load must be clean in accordance with the instruction manual.

   (g) The clamp shall be applied to the load in accordance with the instruction manual.

   (h) Before lifting, make sure that clamp slings (as applicable) are not kinked or twisted.

   (i) Care should be taken to make certain the load is correctly distributed for the clamp(s) being used.

   (j) The temperature of the load shall not exceed the maximum allowable limits of the clamp unless approved by the manufacturer or qualified person.

   (k) Verify that the load is well secured and properly balanced in the lifting device when it is initially lifted.

   (l) Do not allow load or clamp to come into contact with any obstruction.

   (m) Ensure that the lifting device is adequately protected from damage during use.

   (n) Recheck clamp engagement and clamping force whenever the load has been placed on a supporting surface

   (o) The clamp shall not be used for side pulls or sliding the load unless specifically authorized by the manufacturer or a qualified person.

   (p) The operator shall land any attached load and disengage the clamp before leaving the clamp. The operator shall not leave suspended loads unattended. Anchoring clamps are exempt from this requirement.

   (q) The operator shall not ride, or allow others to ride loads or the clamp.

   (r) The operation of the clamp shall be observed before use and during a shift. Any deficiency observed shall be examined by a designated person. If the deficiency constitutes a hazard, the clamp shall be removed from service and tagged “Out of Service.” Any indication of a hazardous condition shall be reported to a qualified person for evaluation.

   (s) Loads shall be guided in such a manner as to avoid endangering hands or other body parts as the load is moved, or if it drops.

   (t) When using 2 or more clamps, follow the manufacturer’s instructions for multiple clamp use.

   (u) A plate clamp(s) shall only be used to lift a single plate unless otherwise approved by clamp manufacturer.

20-6.4.5 Miscellaneous Operating Practices

(a) An operator shall not use a clamp that is tagged “Out of Service” or otherwise designated as nonfunctioning.

(b) “Out of Service” tags on clamps shall not be removed without the approval of the person placing them or a designated person.

(c) The clamp, when not in use, should be stored at an assigned location.

(d) Caution should be taken that operating markings or tags shall not be removed or defaced. Missing or illegible markings or tags shall be replaced.

SECTION 20-6.5: INSTRUCTION MANUALS

The manufacturer shall provide operating instructions, inspection and removal criteria, maintenance and parts information. In addition, the manual shall also provide a statement of those factors that alter the clamp’s capacity and related limitations. Several factors known to affect a clamp’s lifting capabilities are noted below and shall be included in the manual.

(a) Proper load handling instructions and limitations.

(b) Temperature of Load – the manufacturer’s recommendations pertaining to operation of the clamp on loads at temperatures exceeding normal ambient temperatures.
(c) Load dimensions – define the limitations on the size of the load that is recommended.

(d) Surface, Shapes, Material, and Surface Hardness Configuration - provide specific information on what surfaces, shapes, materials, and surface hardness the device is designed to handle, including factors such as rough surface finish, paper, dirt, rust, paint, and any other factors deemed important to the handling of loads.

(e) Maintenance of interfacing surfaces - define the permissible amount of wear, distortion, or damage of the interface components.

(f) Environmental – define conditions that adversely affect the lifting capacity including but not limited to wind, rain, snow, etc.

(g) Lifting Angle Range - define limitations on the lifting angle range.

(h) Minimum Lifting Force - define minimum lifting force necessary to actuate the clamping action. Minimum loads for pressure gripping lifting and structural shape clamps are dependent on clamp wear and material hardness.
BELOW-THE-HOOK LIFTING DEVICES

Chapter 20-0
Scope, Definitions, Personnel Competence, Translations and References

SECTION 20-0.1: SCOPE OF ASME B30.20

Volume B30.20 includes provisions that apply to the marking, construction, installation, inspection, testing, maintenance, and operation of below-the-hook lifting devices, other than components addressed by other ASME B30 volumes or other standards, used for attaching loads to a hoist. The requirements in this volume also apply to clamps used for positioning and anchoring. The devices are arranged in six five chapters as follows:

Chapter 20-1: Structural and Mechanical Lifting Devices
Chapter 20-2: Vacuum Lifting Devices
Chapter 20-3: Close Proximity Operated Lifting Magnets
Chapter 20-4: Remotely Operated Lifting Magnets
Chapter 20-5: Scrap and Material-Handling Grapples
Chapter 20-6: Clamps

(Rationale: addition of new chapter 6 as requested by MC) Revised wording included per first consideration ballot comments
BELOW-THE-HOOK LIFTING DEVICES

Chapter 20-0
Scope, Definitions, Personnel Competence, Translations and References

SECTION 20-0.1: SCOPE OF ASME B30.20

Volume B30.20 includes provisions that apply to the marking, construction, installation, inspection, testing, maintenance, and operation of below-the-hook lifting devices, other than components addressed by other ASME B30 volumes or other standards, used for attaching loads to a hoist. The requirements in this volume also apply to clamps used for positioning and anchoring. The devices are arranged in six chapters as follows:

Chapter 20-1: Structural and Mechanical Lifting Devices
Chapter 20-2: Vacuum Lifting Devices
Chapter 20-3: Close Proximity Operated Lifting Magnets
Chapter 20-4: Remotely Operated Lifting Magnets
Chapter 20-5: Scrap and Material-Handling Grapples
Chapter 20-6: Clamps

SECTION 20-0.2: DEFINITIONS — GENERAL

abnormal operating conditions: environmental conditions that are unfavorable, harmful, or detrimental to or for the operation of the equipment, such as excessively high or low ambient temperatures, exposure to adverse weather, corrosive fumes, dust-laden or moisture-laden atmospheres, and hazardous locations.

administrative or regulatory authority: governmental agency, or the employer in the absence of governmental jurisdiction.

Altered: a physical change, addition, or deletion that modifies the original design, or intended functioning, of the equipment below-the-hook lifting device.

altered: see alteration.

below-the-hook lifting device: a device used for attaching a load to a hoist. The device may contain components such as slings, hooks, and rigging hardware addressed by other ASME B30 volumes or other standards, typically referred to as a lifter.

design category: lifter classification that specifies the design factor to be used to establish static stress limits for the design.

hoist: a machinery unit that is used for lifting and lowering.

lifter: see below-the-hook lifting device.

lifting device: see below-the-hook lifting device.

modification: see alteration.

maintenance parts: parts designated by the manufacturer that may be periodically replaced as part of normal operation of the lifter.

modified: see alteration.

normal operating conditions: conditions during which the lifter is performing functions within the scope of the original design.

qualified person: a person who, by possession of a recognized degree in an applicable field or certificate of professional standing, or who, by extensive knowledge, training, and experience, has successfully demonstrated the ability to solve or resolve problems relating to the subject matter and work.

rated load: the maximum load designated by the manufacturer for which the equipment is designed and built.
by the manufacturer.

repair: the process of reconditioning, renewal, or replacement of parts, components, and/or subsystems to a condition equal to the original manufacturer’s specifications for the purpose of ensuring performance in accordance with the applicable requirements.

service class: lifter classification that establishes the allowable stress range for the specified fatigue life (load cycles).

Severe service: service that involves normal or heavy service with abnormal operating conditions.

shall: a word indicating a requirement indicates that the rule is mandatory and must be followed.

should: a word indicating a recommendation indicates that the rule is a recommendation, the advisability of which depends on the facts in each situation.

(Rationale, global 2014-2)

special or infrequent service: service that involves operation other than normal, heavy, or severe.

SECTION 20-0.3: DEFINITIONS FOR CHAPTER 20-1

abnormal operating conditions: environmental conditions that are unfavorable, harmful, or detrimental to or for the operation of structural and mechanical lifting devices, such as excessively high or low ambient temperatures, exposure to adverse weather, corrosive fumes, dust-laden or moisture-laden atmospheres, and hazardous locations.

friction-type pressure-gripping lifters: lifters that grip the load without significant or harmful permanent deformation of the load surface (see Fig. 20-0.3-1).
Fig. 20-0.3-1. Pressure-Gripping Lifters: Friction-Type Lifters

(a) Plate Clamps

(b) Bar Tong

(c) Vertical Axis Coil Grab

(d) Motor Driven Roll Grab, End Grip

(e) Roll Grab, Core Grip

NOTE:
(1) "©ANSI-1982. Used with permission of American National Standards Institute. Please be advised that ANSI Z229.1-1982 has been withdrawn and is no longer considered an American National Standard. No part of this material may be copied or reproduced in any form, electronic retrieval system or otherwise or made available on the Internet, a public network, by satellite or otherwise without the prior written consent of the ANSI, 25 West 43rd St., New York, NY 10036, (212) 642-4900, http://webstore.ansi.org."
grip ratio: the ratio of the sum of the horizontal forces on one side of the load to the live weight of the load. For example, if the total horizontal force on one side of the load is 100,000 lb and the live load is 50,000 lb, the grip ratio is 2. For purposes of this calculation, the weight of the load does not include the weight of the lifter (see Fig. 20-0.3-2).

heavy service: service that involves operation within the rated load limit that exceeds the limits of normal service.

indentation-type pressure-gripping lifters: lifters that carry the load by applying force to indent the sides of the load (see Fig. 20-0.3-3).

ingot turnover grab: a manipulating lifter [Fig. 20-0.3-4, illustration (e)].

latch: a device for holding a lifter in the open or closed position.
latch, automatic: a sequencing latch mechanism operated by lifter motion.
lifting beam (spreader beam): a load-supporting lifter [see Fig. 20-0.3-51.1-1, illustration (a)].

lock bar sheet lifter: a supporting lifter [see Fig. 20-0.3-5, illustration (j)].

manipulating lifter: a lifter that rotates the load about one or more axes during the lifting process (see Fig. 20-0.3-1.2-1).

mechanical lifting device: a mechanism composed of two or more rigid parts which move with respect to each other for attaching a load to a hoisting device.

service, heavy: service that involves operation within the rated load limit that exceeds the limits of normal service.

normal service, normal:

Design Category A lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit with not more than four operations above 65% of the rated load limit per 24-hr period.

Design Category B lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit, averaging less than 65% of rated load limit.

structural lifting device: a lifter consisting of an assembly of rigid parts designed to hold and attach a load to a hoisting device.

supporting lifter: a lifter that carries the load on rigid projection(s) or bearing surface(s) (see Fig. 20-1.2-10.3-5).

SECTION 20-0.4: DEFINITIONS FOR CHAPTER 20-2
abnormal operating conditions: environmental conditions that are unfavorable, harmful, or detrimental to or for the operation of vacuum lifting devices, such as excessively.
Fig. 20-0.3-3  Pressure-Gripping Lifters: Indentation-Type Lifters

high or low ambient temperatures, exposure to adverse weather, corrosive fumes, dust-laden or moisture-laden atmospheres, and hazardous locations.
four-pad powered vacuum lifter: see Fig. 20-0.4-1, illustration (d).

four-pad powered vacuum lifter manipulator: see Fig. 20-0.4-1, illustration (e).

heavy service: service that involves operation within the rated load limit that exceeds the limits of normal service.

horizontal surface lift: a condition where the surface to which the vacuum pad (or pads) is attached is in a horizontal plane.

multiple-pad mechanical vacuum lifter: see Fig. 20-0.4-1, illustration (c).

nonporous material: a material that is not permeable by fluid/air.

normal service.

Design Category A lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit with not more than four operations above 65% of the rated load limit per 24-hr period.

Design Category B lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit, averaging less than 65% of rated load limit.

porous material: a material that is permeable by fluid/air.

seal ring (seal): that part of the vacuum pad which forms the seal of the vacuum chamber between the vacuum pad body or vacuum lifting device and the attached material.

service, heavy: service that involves operation within the rated load limit that exceeds the limits of normal service.

service, normal

Design Category A lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit with not more than four operations above 65% of the rated load limit per 24-hr period.

Design Category B lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit, averaging less than 65% of rated load limit.

service, severe: service that involves normal or heavy service with abnormal operating conditions.

service, special or infrequent: service that involves operation other than normal, heavy, or severe.

single-pad mechanical vacuum lifter: see Fig. 20-20.14-1, illustration (b).

two-pad mechanical vacuum lifter: see Fig. 20-20.14-1, illustration (a).

vacuum: pressure less than ambient atmospheric pressure.

vacuum lifter: a below-the-hook lifting device for lifting and transporting loads using a holding force by means of vacuum (see Fig. 20-20.14-1).

vacuum manipulator: a vacuum lifter capable of repositioning the load while suspended.

vacuum pad: a device that applies a holding force on the load by means of vacuum.

vacuum reservoir: the evacuated portion of the vacuum system that functions to compensate for leakage into the vacuum system or to provide a vacuum reserve in the event of vacuum generator failure.

vertical surface lift: a condition where the surface to which a vacuum pad is attached is in a vertical plane.

SECTION 20-0.5: DEFINITIONS FOR CHAPTER 20-3

abnormal operating conditions: environmental conditions that are unfavorable, harmful, or detrimental to or for the operation of close proximity lifting magnets, such as excessively high or low ambient temperatures, exposure to adverse weather, corrosive fumes, dust laden or moisture laden atmospheres, and hazardous locations.

battery backup system (backup): batteries used to guard against inadvertent load release due to the loss of primary power to the magnet system.

battery powered lifting electromagnet: a lifting magnet that requires continuous current supplied by a battery to maintain holding force [see Fig. 20-3.1-1, illustration (a)].

breakaway force: the force required to detach a properly engaged lifting magnet from a piece of ferromagnetic material when the force is applied normal to the lifting surface of the magnet.

breakaway force test: a test that is carried out per para. 20-3.3.8.2 in order to establish the rated breakaway force

close proximity operated lifting magnet: a lifting magnet used in such a fashion that the operator manually positions the lifting magnet on the load, and manually guides the lifting magnet and load during a lift.

cold current: that current drawn by the lifting magnet when its coil is at 68°F (20°C) and at rated voltage.

magnet duty cycle: an 8, 16, or 24 hr rating with the percentage of time an electromagnet can be energized (Te), relative to
total cycle time. De-energized time equals $T_d$. If not rated as continuous, the magnet duty cycle rating includes information on maximum continuous energized time and minimum de-energized time to prevent overheating.

$$\text{magnet duty cycle} = \frac{T_e}{T_e + T_d} \times 100$$

and expressed as a percentage.

EXAMPLE: 3 min energized on, 2 min de-energized off equal

$$\frac{3}{3 + 2} \times 100 = 60\%$$

**electrically controlled permanent lifting magnet:** a lifting magnet that derives holding force from permanent magnet material and requires electrical current during attachment or release. Also known as Electro Perm, Perm Electro, or similar names [see Fig. 20-3-1.1-1, illustration (b)].

**externally powered lifting electromagnet:** a lifting magnet suspended from a crane that requires power from an external source.

**force, breakaway:** the force required to detach a fully energized lifting magnet from a piece of ferromagnetic material when the force is applied normal to the lifting surface of the magnet.

**general application lifting magnet:** lifting magnets that are intended by the manufacturer to be used on a number of different geometrical shapes and do not fall under the category of remotely operated lifting magnets.

**heavy service:** service that involves operation within the rated load limit that exceeds the limits of normal service.

**indicator, internal control function indicator:** an indicator which shows that the permanent magnet material in one type of electrically controlled permanent magnet has been positioned internally to provide full magnetic attraction.

**load (capacity), rated:** the maximum load that the lifting magnet is designated to handle by the manufacturer.

**load (capacity), specified application:** a load applied to the lifting magnet when it is used to handle a specified load.

**load (maximum), specified:** a load identified by a part number or other controlled definition.

**magnet, lifting: electromagnet, battery powered:** a lifting magnet that requires continuous current supplied by a battery to maintain holding force [see Fig. 20-0.5-1, illustration (a)].

**electromagnet, externally powered:** a lifting magnet suspended from a crane that requires power from a source external to the crane.

**permanent magnet, electrically controlled:** a lifting magnet that derives holding force from permanent magnet material and requires current only during the period of attachment or release [see Fig. 20-0.5-1, illustration (b)].

**manually controlled permanent lifting magnet, manually controlled:** a lifting magnet that derives holding force from permanent magnet material and requires a manual effort during the period of attachment or release [see Fig. 20-30.15-1, illustration (c)].

(e) Remote Operated Lifting Electromagnet — Rectangular
magnet, lifting, close proximity operated: a lifting magnet used in such a fashion that the operator manually positions the lifting magnet on the load, and manually guides the lifting magnet and load during a lift.

magnet, lifting, general application: lifting magnets that are intended by the manufacturer to be used on a number of different geometrical shapes and do not fall under the category of remotely operated lifting magnets.

magnet, lifting, remotely operated: a lifting magnet that does not require the operator or other personnel to be in close proximity to the lifting magnet or its load while the lifting magnet is in use.

magnet, lifting, specified application: lifting magnets that are designed for lifting specified geometrical configurations and weights of designated parts, identified by part number or other controlled definition and used in a controlled manner.

service, heavy: service that involves operation within the rated load limit that exceeds the limits of normal service.

service, normal: service that involves operation with various weights within the rated load limit, averaging less than 65% of rated load (capacity) with the magnet operating at, or below, the rated duty cycle over one shift (8 hr).

service, severe: service that involves normal or heavy service with abnormal operating conditions.

service, special or infrequent: service that involves operation other than normal, heavy, or severe.

rated load: the maximum load that the lifting magnet is designated by the manufacturer to handle.

remotely operated lifting magnet: a lifting magnet that does not require the operator or other personnel to be in close proximity to the lifting magnet or its load while the lifting magnet is in use.

specified application breakaway force test: a test that is carried out in accordance with instructions from the manufacturer of the lifting magnet in order to establish the application breakaway force.

specified application lifting magnet: lifting magnets that are designed for lifting specified geometrical configurations and weights of designated parts, identified by part number or other controlled definition and used in a controlled manner.

specified application load: a load applied to the lifting magnet when it is used to handle a specified load.

test, application breakaway force: a test that is carried out in accordance with instructions from the manufacturer of the lifting magnet in order to establish the application breakaway force.

test, breakaway force: a test that is carried out per para. 20-3.8.2 in order to establish the rated breakaway force.

SECTION 20-0.6: DEFINITIONS FOR CHAPTER 20-4

abnormal operating condition: environmental conditions that are unfavorable, harmful, or detrimental to or for the operation of remotely operated lifting magnets, such as excessively high or low ambient temperatures, exposure to adverse weather, corrosive fumes, dust-laden or moisture-laden atmospheres, and hazardous locations.

close proximity operated lifting magnet: a lifting magnet used in such a fashion that the operator manually positions the lifting magnet on the load, and manually guides the lifting magnet and load during a lift.

cold current: the current drawn by the lifting magnet when its coil is at 68°F (20°C) and at rated voltage.

magnet duty cycle: an 8, 16, or 24 hr rating with The percentage of time an electromagnet can be energized (Te), relative to total cycle time. De-energized time equals Td. If not rated as continuous, the magnet duty cycle rating includes information on maximum continuous energized time and minimum de-energized time to prevent overheating.

\[
magnet \text{ duty cycle} = \frac{T_e}{T_e + T_d} \times 100
\]

and expressed as a percentage.

EXAMPLE: 3 min energized on, 2 min de-energized off equal
Heavy service: service that involves operation within the rated load limit that exceeds the limits of normal service.

Load (capacity), rated: the maximum load that the lifting magnet is designated to handle by the manufacturer.

Magnet, lifting, close proximity operated: a lifting magnet used in such a fashion that the operator manually positions the lifting magnet on the load, and manually guides the lifting magnet and load during a lift.

Magnet, lifting, remotely operated: a lifting magnet that does not require the operator or other personnel to be in close proximity to the lifting magnet or its load while the lifting magnet is in use [see Fig. 20-4.1-1, illustrations (a) and (b)].

Service, heavy: service that involves operation within the rated load limit that exceeds the limits of normal service.

Normal service, normal: service that involves operation with various weights within the rated load limit, averaging less than 65% of rated load (capacity) with the magnet operating at, or below, the rated duty cycle over one shift (8 hr).

Rated load: the maximum load that the lifting magnet is designated by the manufacturer to handle.

Remotely operated lifting magnet: a lifting magnet that does not require the operator or other personnel to be in close proximity to the lifting magnet or its load while the lifting magnet is in use [see Fig. 20-0.5-1, illustrations (d) and (e)].

Service, severe: service that involves normal or heavy service with abnormal operating conditions.

Service, special or infrequent: service that involves operation other than normal, heavy, or severe.

Section 20-0.7: Definitions for Chapter 20-5

Abnormal operating conditions: environmental conditions that are unfavorable, harmful, or detrimental to or for the operation of scrap and material handling grapples, such as excessively high or low ambient temperatures, exposure to adverse weather, corrosive fumes, and hazardous locations.

Rated volume capacity: the volume of scrap/material that can be handled with the grapple closed and the tine tips touching. This is to be expressed in cubic yards or cubic meters.

Scrap and material handling grapples: various types of scrap and material handling grapples are shown in Fig. 20-0.7-1.

Heavy service: heavy: service that involves operation within the rated load limit for
a) One work shift per day working in material that will not crush or deform as the grapple closes
b) Two or more work shifts per day in material that will crush or deform as the grapple closes.

Normal service, normal: service that is limited to operation for a period of one shift or less per day working within the rated load limit in material that will crush or deform as the grapple closes.

Service, severe: service that involves normal or heavy service with abnormal operating conditions.

Service, special or infrequent: service that involves operation other than normal, heavy, or severe.
Fig. 20-0.7-1 Scrap and Material-Handling Grapples

(a) Four-Tine Orange Peel Grapple
(b) Electrohydraulic Grapple

(c) Three-in-One Grapple
(d) Magnet Grapple

(e) Car Body Grapple
tine: the hinged portion of the grapple that comes in contact with or encompasses the load.

SECTION 20-0.8: DEFINITIONS FOR CHAPTER 20-6

friction-type pressure-gripping clamps: clamps that grip the load without significant or harmful permanent deformation of the load surface (see Figs. 20-6.0-2 and 20-6.0-3).

indentation-type pressure-gripping clamps: clamps that carry the load by applying force to indent the sides of the load (see Fig. 20-6.0-4).

heavy service: service that involves operation within the rated load limit that exceeds the limits of normal service.

normal service:
  Design Category A lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit with not more than four operations above 65% of the rated load limit per 24-hr period.
  Design Category B lifters (for ASME BTH-1): service that involves operation with various weights within the rated load limit, averaging less than 65% of rated load limit.

(Rationale: addition of new chapter 6)

SECTION 20-0.98: PERSONNEL COMPETENCE

Persons performing the functions identified in this volume shall, through education, training, experience, skill, and physical fitness, as necessary, be competent and capable to perform the functions as determined by the employer or employer’s representative.

SECTION 20-0.109: TRANSLATIONS

(Rationale: update of Translations Global)

20-0.10.1: Technical and Safety-Related Information

The manufacturer shall provide instructions [manual(s)] for the operation, inspection, testing, maintenance, assembly and disassembly of the equipment.

(a) The instructions shall be provided in a language specified by the purchaser at the time of the initial sale by the manufacturer.

(b) Pictograms used to identify controls shall be described in the instructions. The pictograms should comply with ISO 7000, ISO 7296, or other recognized source, if previously defined.

(c) Translations of the original language instructions [if the manufacturer no longer exists, translation of the instructions with the equipment is acceptable] shall meet professional translation industry standards, which include, but are not limited to, the following:

  1. translating the complete paragraph message, instead of word by word;
  2. ensuring grammatical accuracy;
  3. preserving the source document content without omitting or expanding the text;
  4. translating the terminology accurately;
  5. reflecting the level of sophistication of the original document.

(d) The finished translation shall be verified for compliance with paragraphs (c) (1) through (c) (5) by a qualified person having an understanding of the technical content of the subject matter.

20-0.10.2 Translation of Technical and Safety-Related Information and Manual(s).

The entities responsible for the operation, use, inspection, testing, and maintenance of the covered equipment shall have the technical and safety-related information available in a language that their employees can read and understand. The entities shall obtain a translation of the original manufacturer’s written safety information and manuals from the manufacturer or from a translation service provider if the manuals are not in a language understood by their employees. The translation(s) shall meet the requirements of Section 20-0.10.1 (c) and (d).

Translation of non-English documentation into English.

(a) The wording of written non-English safety information and manuals regarding use, inspection, and maintenance shall be translated into English by professional translation industry standards, which include, but are not limited to, the following:

  1. Translation of the complete paragraph message, instead of word by word
  2. Grammatically accurate
  3. Respectful of the source document content without omitting or expanding the text
(4) Translate the terminology accurately.
(5) Reflect the level of sophistication of the original document.
(b) The finished translation shall be verified for compliance with paras. 20-0.9(a)(1) through (a)(5) by a qualified person having an understanding of the technical content of the subject matter.
(c) Pictograms used to identify controls shall be described in the manuals. The pictograms should comply with ISO 7000, ISO 7296, or other recognized source, if previously defined. The text of the description shall meet the criteria of paras. (a) and (b).
(d) Any non-English documentation provided in addition to English shall be translated and reviewed in accordance with the requirements listed above.

ISO 7000 & 7296
Chapter 20-1
Structural and Mechanical Lifting Devices

SECTION 20-1.1: SCOPE
(Rationale: addition of new chapter 6)

Chapter 20-1 applies to the classification, marking, construction, installation, inspection, testing, maintenance, and operation of structural and mechanical lifting devices. Within Chapter 20-1, structural and mechanical lifters/lifting devices are categorized as load supporting lifters, and include a positive connection to the load or other component, indentation type pressure-gripping lifters, and friction type pressure-gripping lifters. Structural and Mechanical Lifting Devices frequently contain components within the scope of Chapters 20-2 through 20-6 for load attachment.

SECTION 20-1.2: MARKING, CONSTRUCTION, AND INSTALLATION

20-1.2.1 Marking

(a) Rated Load. The rated load of the lifting device shall be legibly marked on its main structure or on a tag attached to its main structure where it is visible. If the lifting device is made up of several lifters, each detachable from the group, these lifters shall also be marked with their individual rated loads.

(b) Identification. All new structural and mechanical lifting devices shall be marked with, but not limited to, the following information:

1. manufacturer’s name and contact information address
2. serial number (unique unit identifier)
3. lifter weight, if over 100 lb (45 kg)
4. cold current (amps) (when applicable)
5. rated voltage (when applicable)
6. rated load [as described in para. 20-1.2.1(a)]
7. ASME BTH-1 Design Category
8. ASME BTH-1 Service Class

(c) Repaired or Altered Lifters. All repaired or altered structural and mechanical lifters shall be provided with identification displaying, but not limited to, the following information:

1. name and contact information address of the repairer or alterer
2. repairer’s or alterer’s unit identification
3. lifter weight (if altered)
4. cold current (amps) (if altered)
5. rated voltage (if altered)
6. rated load (if altered) [as described in para. 20-1.2.1(a)]
7. ASME BTH-1 Design Category (if altered)
8. ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(d) Product Safety Labels

1. Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011, to bring the label to the attention of the operator. The label should include cautionary language identifying hazards, methods for accident prevention, and refer to Instruction Manuals for additional information.

2. Where size or shape of the lifter prohibits the inclusion of all or any such markings, a label shall be affixed, referring user to consult manufacturer’s instruction manual for product safety information.

(e) Operating Controls. Each control shall be clearly marked describing resulting motion or function of the lifter.

20-1.2.2 Construction

The manufacturer shall verify that structural and mechanical lifting devices are designed by or under the direct supervision of a qualified person. The design shall be in accordance with ASME BTH-1, and shall consider the stresses resulting from the application of rated load plus the weight of the lifting device.
Structural and mechanical lifting devices shall be designed to ASME BTH-1 Design Category B (static strength criteria) and the proper Service Class (fatigue life criteria) selected for its number of load cycles, unless a qualified person representing the owner, purchaser, or user of the lifting device determines and can demonstrate that ASME BTH-1 Design Category A is appropriate.

Design Category A shall only be designated when the magnitude and variation of loads applied to the lifter are predictable and do not exceed the rated capacity, where the loading and environmental conditions are accurately defined, service is not severe, and the anticipated number of load cycles does not exceed Service Class 0.

(a) Welding. All welding shall be in accordance with ANSI/AWS D14.1 and ASME BTH-1, 1.4.6.

(b) Guards for Moving Parts. Exposed moving parts, such as, but not limited to, gearing, projecting shafts, and chain drives, that constitute a hazard under normal operating conditions, should be guarded.

(c) Electrical Equipment. External power supply, electrical equipment, and wiring for below-the-hook lifters shall comply with ANSI/NFPA 70 and be in accordance with ASME BTH-1.

(d) Alterations. Structural and mechanical lifters may be altered or rerated, provided such alterations are analyzed and approved by the equipment manufacturer or a qualified person. A rerated lifter, or one whose components have been altered, shall conform to para. 20-1.2.2 and be tested according to para. 20-1.3.8. New rated load shall be displayed in accordance with para. 20-1.2.1.

(e) Slings, when employed, shall meet the requirements of ASME B30.9.

(f) Hooks, when employed, shall meet the requirements of ASME B30.10.

(g) Rigging hardware, when employed, shall meet the requirements of ASME B30.26.

20-1.2.3 Installation

(a) The lifter shall be installed in accordance with the manufacturer’s instructions.

(b) The installer shall check for correct rotation of all motors.

SECTION 20-1.3: INSPECTION, TESTING, AND MAINTENANCE

20-1.3.1 Inspection Classification

General. All inspections shall be performed by a designated person. Any deficiencies identified shall be examined and a determination made by a qualified person as to whether they constitute a hazard, and if so, what additional steps need to be taken to address the hazard. (Rationale: Global, 2014-1, inspections)

Inspection of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with the inspection requirements in the applicable volume.

(a) Initial Inspection
   (1) New and reinstalled lifters shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
   (2) Altered or repaired lifters shall be inspected. The inspection may be limited to the provision components affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedure for lifters in regular service is divided into three general classifications based upon the intervals at which inspection should be performed. The intervals, in turn, are dependent upon the critical components of the lifters and the degree of their exposure to wear, deterioration, or malfunction. The three general classifications are herein designated as every lift, frequent, and periodic, with respective intervals between inspections as defined below.
   (1) Every Lift Inspection. Visual examination by the operator before and during each lift made by the lifter.
   (2) Frequent Inspection. Visual examinations by the operator or other designated persons with records not required.
      (a) Normal service — monthly
      (b) Heavy service — weekly to monthly
      (c) Severe service — daily to weekly
      (d) Special or infrequent service — as recommended by a qualified person before and after each lift occurrence
   (3) Periodic Inspection. Visual inspection making records of apparent external conditions to provide the basis for a continuing evaluation. An external code mark on the lifter is an acceptable identification in lieu of records.
      (a) Normal service for equipment in place — yearly
      (b) Heavy service [as in (a) above, unless external conditions indicate that disassembly should be done to permit detailed inspection] — semiannually
      (c) Severe service [as in (b) above] — quarterly
      (d) Special or infrequent service — as recommended by a qualified person before the first such occurrence lift and as directed by the qualified person for any subsequent occurrences lifts

20-1.3.2 Every Lift Inspection

Items such as the following shall be inspected by the operator before and/or during every lift for any indication of damage as specifically indicated, including observations during operation for any damage that might occur during the lift:
   (a) surface of the load for debris
   (b) condition and operation of the controls
   (c) condition and operation of the indicators and meters when installed

20-1.3.3 Frequent Inspection (See Also Table 20-1.3.3-1)

Items such as the following shall be inspected for damage at intervals as defined in para. 20-1.3.1(b)(2), including observations during operation for any indications of damage that might appear between inspections. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. For all lifters, inspect:
   (a) structural members for deformation, cracks, or excessive wear on any part of the lifter
   (b) loose or missing guards, fasteners, covers, stops, or nameplates
   (c) all functional operating mechanisms and automatic hold-and-release mechanisms for misadjustments interfering with operation
   (d) missing or illegible operating control markings

NOTES:
(1) By operator or designated person with records not required.
(2) Visual inspection by designated person making records of apparent external conditions to provide the basis for a continuing evaluation.
(3) As in Note (2), unless external conditions indicate that disassembly should be done to permit detailed inspection.
20-1.3.4 Periodic Inspection (See Also Table 20-1.3.3-1)

Complete inspection of the lifter shall be performed at intervals as defined in para. 20-1.3.1(b)(3). Any deficiencies, such as listed below, shall be examined and determination made as to whether they constitute a hazard. These inspections shall include the requirements of para. 20-1.3.3 and, in addition, items such as the following:

(a) loose bolts or fasteners
(b) cracked or worn gears, pulleys, sheaves, sprockets, bearings, chains, and belts
(c) excessive wear of friction pads, linkages, and other mechanical parts
(d) excessive wear at hoist hooking points and load support clevises or pins
(e) missing or illegible product safety labels required by para. 20-1.2.1(d)

20-1.3.5 Lifting Devices Not in Regular Use

A lifter that has been idle for a period of 1 mo to 1 yr shall be inspected in accordance with para. 20-1.3.3 before being placed in service. A lifter that has been idle for a period of 1 yr or more shall be inspected in accordance with para. 20-1.3.4 before being returned to service.

20-1.3.6 Inspection Records

Dated inspection reports shall be made on critical items such as those listed in para. 20-1.3.4. Records should be available for each periodic inspection and when the lifter is either altered or repaired.

20-1.3.7 Repairs

Damage disclosed by the inspection requirements of Section 20-1.3 shall be corrected according to the procedures outlined in para. 20-1.3.9 before operation of the lifter is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-1.3.8 Testing

20-1.3.8.1 Operational Tests

(a) New and reinstalled lifting devices shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person, prior to initial use to verify compliance with applicable provisions of this Volume, including, but not limited to, the following:

(1) Moving Parts. Lifters with moving parts shall be tested to determine that the lifter operates in accordance with manufacturer’s instructions.

(2) Latches. Lifters with manually operated or automatic latches shall be tested to determine that the latch operates in accordance with manufacturer’s instructions.

(b) Altered or repaired lifters shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person. This test may be limited to the provision components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(c) All indicator lights, gages, horns, bells, alarms, pointers, and other warning devices shall be tested.

(d) Dated reports of all operational tests shall be filed.

20-1.3.8.2 Load Test

(a) Prior to initial use, all new, altered, or repaired lifting devices should be tested and inspected. If performed, tests shall be done under the direction of the manufacturer or a qualified person and a written report be furnished by such a person, confirming the load rating of the lifter. The load rating should not be more than 80% of the maximum load sustained during the test. Test loads shall not be more than 125% of the rated load unless otherwise recommended by the manufacturer. Test reports should be available.

(b) The load test, if made, shall consist of the following operations as a minimum requirement:

(1) Hoist the test load a sufficient distance to ensure the load is supported by the lifter, or apply the required load if the test is made using a testing machine.

(2) After the test load is released, visually inspect the lifter for deformation, cracks, or other defects.

(c) Tests of altered or repaired lifters may be limited to the provision components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

20-1.3.9 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the lifter manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the lifter application and operations.

(b) Maintenance Procedure

(1) Before adjustments and repairs are started on a lifter, the following precautions shall be taken:

(a) All sources of power shall be disconnected, locked out, and tagged “Out of Service.”

(b) A lifter removed from service for repair shall be tagged “Out of Service.”

(c) Relieve fluid pressure from all circuits before loosening or removing fluid power components.

(2) Only designated persons shall perform adjustments, repairs and tests when required.

(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.

(4) After adjustments and repairs have been made, the lifter shall not be returned to service until it has been
inspected according to para. 20-1.3.4.

(5) Dated records of repairs and replacements should be made.

SECTION 20-1.4: OPERATION

20-1.4.1 Operators

Below-the-hook lifting devices shall be operated only by trained, designated persons.

20-1.4.2 Qualifications

Qualifications for operators of below-the-hook lifting devices are as follows:

(a) The operator shall be instructed in the use of the device by a designated person. Instructions should include, but not be limited to, the following:

1. Application of the lifter to the load and material handling device, and adjustments, if any, that adapt the lifter to various sizes or kinds of loads
2. Instructions in any special operations or precautions
3. The manufacturer’s suggested operating procedures
4. Condition of the load itself required for operation of the lifter, such as, but not limited to, balance, surface cleanliness, flatness, bending, and load thickness
5. Storage of the lifter to protect it from damage
6. Not exceeding the rated load of the lifting device nor the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and rigging
7. The proper attachment of adapters to lifting device for special load handling
(b) The operator shall demonstrate the ability to operate the lifter as instructed before assuming responsibility for using the lifter.
(c) The operator shall demonstrate an understanding of standard hand signals when applicable.

20-1.4.3 Responsibilities

While the organizational structure of various projects may differ, the following roles are described here for purposes of delineating responsibilities. All responsibilities listed below shall be assigned in the worksite organization. (A single individual may perform one or more of these roles.)

operator: directly controls the lifting device’s functions.
owner: has custodial control of a lifting device by virtue of lease or ownership.

These persons and roles may or may not match the persons and roles associated with the hoisting equipment in use.

20-1.4.3.1 Responsibilities of the Lifting Device Owner. The responsibilities of the lifting device owner shall include the following:

(a) Providing a lifting device, and all necessary components specified by the manufacturer, that meets the requirements of Sections 20-1.2 and 20-1.3 as well as specific job requirements.
(b) Providing all applicable operating instructions.
(c) Providing field assembly, and disassembly (if applicable), operation and maintenance information, and warning decals and placards installed as prescribed by the lifting device manufacturer.
(d) Establishing an inspection, testing, and maintenance program in accordance with Section 20-1.3.
(e) Using designated personnel to perform the required maintenance, repair and inspections.
(f) Ensuring that the lifting device is in proper operating condition prior to initial use at the worksite by the following:

1. Verifying that all inspections have been performed as required by Section 20-1.3
2. Verifying that the lifting device has the necessary lifting capacity to perform the proposed lifting operations in the planned configuration
3. Using operators that meet the requirements of para. 20-1.4.2.
(h) Ensuring that all personnel involved in maintenance, repair, assembly, disassembly, and inspection are aware of their responsibilities, assigned duties, and the associated hazards.
(i) Determining if additional regulations are applicable to lifting device operations.
(j) Ensuring that conditions that may adversely affect lifting device operations are addressed. Such conditions include, but are not limited to, the following:

1. Wind velocity or gusting winds
2. Precipitation
3. Fog
4. Extreme temperatures
5. Lighting

(k) Addressing safety concerns raised by the operator or other personnel and being responsible if he and a qualified person decides to overrule those concerns and directs lifting device operations to continue. (In all cases, the manufacturer’s criteria for safe operation and the requirements of this Volume shall be followed.)

20-1.4.3.2 Responsibilities of Operators. The operator shall be responsible for the following listed items. The operator
shall not be responsible for hazards or conditions that are not under his direct control and that adversely affect operation of the lifting device. Whenever the operator has doubt as to the safety of lifting device operations, the operator shall place the load in a safe condition and stop the lifting device’s functions in a controlled manner. Use of the lifting device shall resume only after safety concerns have been addressed or the continuation of lifting device operations is directed by the owner.

The operator’s responsibilities shall include the following:
(a) reviewing the requirements for the lifting device with the owner before operations.
(b) knowing what types of site conditions could adversely affect the operation of the lifting device and consulting with the owner concerning the possible presence of those conditions.
(c) understanding and applying the information contained in the lifting device manufacturer’s operating manual.
(d) understanding the lifting device’s functions and limitations as well as its particular operating characteristics.
(e) performing an inspection is performed prior to every lift as specified in para. 20-1.3.2.
(f) promptly reporting the need for any adjustments or repairs to a designated person.
(g) following applicable lock out/tag out procedures.
(h) not operating the lifting device when physically or mentally unfit.
(i) ensuring that all controls are in the off or neutral position and that all personnel are in the clear before energizing the lifting device.
(j) not engaging in any practice that will divert his attention while operating the lifting device.
(k) testing the lifting device function controls that will be used and operating the lifting device only if those function controls respond properly.
(l) operating the lifting device’s functions, under normal operating conditions, in a smooth and controlled manner.
(m) knowing and following the procedures specified by the manufacturer or approved by a qualified person, for assembly, disassembly, setting up, and reeving/ rigging of the lifting device.
(n) considering all factors known that might affect the lifting device capacity and informing the owner of the need to make appropriate adjustments.
(o) understanding basic load attachment procedures.
(p) responding only to instructions from designated persons. However, the operator shall obey a stop order at all times, no matter who gives it.
(q) ensuring that all personnel shall stay clear of the load.

20-1.4.4 Lifting Device Operating Practices (Rationale: Global, rigger responsibilities, as applicable for BTH)
(a) Lifting devices shall be operated only by the following qualified personnel:
   (1) designated persons
   (2) trainees under the supervision of a designated person, the number of trainees permitted to be supervised by a single designated person, the physical location of the designated person while supervising, and the type of communication required between the designated person and the trainee shall be determined by a qualified person
   (3) maintenance and test personnel, when it is necessary in the performance of their duties
   (4) inspectors (lifting devices)
(b) Ensure the weight of the load and its approximate center of gravity have been obtained, provided or calculated.
(c) The lifting device shall not be loaded in excess of its rated load or handle any load for which it is not designed.
(d) Properly attaching the lifting device to the hook, shackle, or other load handling device.
(e) The lifter shall be applied to the load in accordance with the instruction manual.
(f) Before lifting, the operator shall make sure that lifter ropes or chains are not kinked, and that multiple part lines are not twisted around each other.
(g) Care should be taken to make certain the load is correctly distributed for the lifter being used.
(h) The temperature of the load should not exceed the maximum allowable limits of the lifter.
(i) The lifter shall be brought over the load in such a manner as to minimize swinging.
(j) Care shall be taken that there is not sudden acceleration or deceleration of the load.
(k) Verify that the operator shall ensure that the load is well secured and properly balanced in the lifting device when it is initially lifted.
(l) Do not allow load or lifter to come into contact with any obstruction.
(m) The operator shall ensure that the lifting device is adequately protected from damage during use.
(n) The operator shall avoid carrying the load over people.
(o) The lifter shall not be used for side pulls or sliding the load unless specifically authorized by a qualified person.
(p) The operator shall land any attached load and store the lifter before leaving the lifting device. The operator shall not leave suspended loads unattended.
(q) The operation of the lifter shall be observed before, during, and after a shift. Any deficiency observed shall be examined by a designated person. If the deficiency constitutes a hazard, the lifter shall be removed from service and tagged “Out of Service.” Any indication of a hazardous condition shall be reported to a qualified person for evaluation.
Loads shall be guided in such a manner as to avoid endangering hands or other body parts as the load is lowered, moved, or if it drops.

20-1.4.5 Miscellaneous Operating Practices

(a) An operator shall not use a lifting device that is tagged “Out of Service” or otherwise designated as nonfunctioning.

(b) “Out of Service” tags on lifting devices shall not be removed without the approval of the person placing them or a designated person.

(c) The lifter, when not in use, should be stored at an assigned location.

(d) Caution should be taken that operating markings or tags shall not be removed or defaced. Missing or illegible markings or tags shall be replaced.

SECTION 20-1.5: INSTRUCTION MANUALS

Operating instructions and maintenance and parts information shall be furnished by the manufacturer.
SECTION 20-2.1: SCOPE

Chapter 20-2 applies to the marking, construction, installation, inspection, testing, maintenance, and operation of vacuum below-the-hook lifting devices. The provisions of Chapter 20-2 apply to all power operated and mechanically operated vacuum lifting and manipulating devices, except those vacuum lifting devices handling porous materials that require special design considerations.

SECTION 20-2.2: MARKING, CONSTRUCTION, AND INSTALLATION

20-2.2.1 Marking

(a) Rated Load. The rated load of the lifter and each pad shall be legibly marked on its main structure or on a tag attached to its main structure where it is visible. This marking shall refer to the instruction manual for information relating to decreases in rating due to additional considerations.

(b) Identification. All newly vacuum lifting devices shall be marked with, but not limited to, the following information:

1. manufacturer’s name and contact information
2. serial number (unique unit identifier)
3. lifter weight
4. electrical power requirements (when applicable)
5. pressure and volume of compressed air required (when applicable)
6. rated load [as described in para. 20-2.2.1(a)]
7. ASME BTH-1 Design Category
8. ASME BTH-1 Service Class

(c) Repaired or Altered Lifters. All repaired or altered vacuum lifting devices shall be provided with identification displaying, but not limited to, the following information:

1. name and contact information of the repairer or alterer
2. repairer’s or alterer’s unit identification
3. lifter weight (if altered)
4. electrical power requirements (if altered)
5. pressure and volume of compressed air required (if altered)
6. rated load (if altered) [as described in para. 20-2.2.1(a)]
7. ASME BTH-1 Design Category (if altered)
8. ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(d) Product Safety Labels

1. Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011, to bring the label to the attention of the operator. The label should include cautionary language identifying hazards, methods for accident prevention, and refer to Instruction Manuals for additional information.

2. Where size or shape of lifter prohibits the inclusion of all or any such markings, a label shall be affixed, referring user to consult manufacturer’s instruction manual for product safety information.

(e) Operating Controls

1. Operating Controls

(a) Vacuum Lifter Design. The manufacturer shall verify that vacuum lifting devices are designed by or under the supervision of a qualified person. The design shall be in accordance with ASME BTH-1.

(b) Welding. All welding shall be in accordance with ASME BTH-1, 1.4.6.

(c) Electrical Equipment. External power supply, electrical equipment, and wiring for below-the-hook lifters shall be in accordance with ASME BTH-1.

Page 70 of 104
(d) Alterations. Vacuum lifters may be altered or rerated, provided such alterations are analyzed and approved by the equipment manufacturer or a qualified person. A rerated lifter or one whose components have been altered shall conform to this para. 20-2.2.2 and be tested according to para. 20-2.3.8. The new rated load shall be displayed in accordance with para. 20-2.2.1(a).

(e) Slings, when employed, shall meet the requirements of ASME B30.9.

(f) Hooks, when employed, shall meet the requirements of ASME B30.10.

(g) Rigging hardware, when employed, shall meet the requirements of ASME B30.26.

20-2.2.3 Installation

(a) The vacuum lifting device shall be assembled and installed in accordance with the manufacturer’s instructions.

(b) The installer shall ensure that the power supply is the same as that shown on the nameplate.

(c) The electrical power supply to the vacuum lifter shall be connected to the line side of the crane disconnect or to an independent circuit.

(d) The installer shall check for correct rotation of all motors.

(e) Prior to initial use, the lifter shall be tested per para. 20-2.3.8.

(f) Operating instructions, maintenance, and parts information shall be furnished by the manufacturer.

(g) External power supply and electrical equipment for below-the-hook lifters shall comply with ANSI/NFPA 70.

SECTION 20-2.3: INSPECTION, TESTING, AND MAINTENANCE

20-2.3.1 Inspection Classification

General. All inspections shall be performed by a designated person. Any deficiencies identified shall be examined and a determination made by a qualified person as to whether they constitute a hazard, and if so, what additional steps need to be taken to address the hazard. (Rationale: Global, 2014-1, inspections)

Inspection of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with the inspection requirements in the applicable volume.

(a) Initial Inspection

(1) New and reinstalled vacuum lifters shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.

(2) Altered or repaired vacuum lifters shall be inspected. The inspection may be limited to the provision components affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedure for vacuum lifting devices in regular service is divided into three general classifications, based upon the intervals at which inspection should be performed. The intervals, in turn, are dependent upon the nature of the critical components of the vacuum lifting device and the degree of their exposure to wear, deterioration, or malfunction. The three general classifications are designated as every lift, frequent, and periodic, with respective intervals between inspections as defined below.

(1) Every Lift Inspection. Visual examination by the operator before and during each lift made by the vacuum lifting device.

(2) Frequent Inspection. Visual examinations by the operator or other designated persons with records not required.

(a) Normal service — monthly

(b) Heavy service — weekly to monthly

(c) Severe service — daily to weekly

(d) Special or infrequent service — as recommended by a qualified person before and after each lift occurrence

(3) Periodic Inspection. Visual inspection making records of apparent external conditions to provide the basis for a continuing evaluation. An external coded mark on the vacuum lifting device is an acceptable identification in lieu of records.

(a) Normal service for equipment in place — yearly

(b) Heavy service [as in (a) above, unless external conditions indicate that disassembly should be done to permit detailed inspection] — semiannually

(c) Severe service [as in (b) above] — quarterly

(d) Special or infrequent service — as recommended by a qualified person before the first occurrence lift and as directed by the qualified person for any subsequent lift occurrences

20-2.3.2 Every Lift Inspection

Items such as the following shall be inspected by the operator before and/or during every lift for any indication of damage as specifically indicated, including observations during operation for any damage that might occur during the lift:

(a) surface of the load for debris

(b) seal of the vacuum pad for debris

(c) condition and operation of the controls

(d) condition and operation of the indicators, meters, and pumps when installed

20-2.3.3 Frequent Inspection

Items such as the following shall be inspected for damage at intervals as defined in para. 20-2.3.1(b)(2), including observations during operation for any indications of damage that might appear between inspections. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. For all vacuum lifters, inspect

(a) structural members for deformation, cracks, and excessive wear on any part of the lifter.

(b) the vacuum generator for output.

(c) all vacuum pad seal rings for cuts, tears, excessive wear, and presence of foreign particles.

(d) all vacuum lines and vacuum line connections for leakage, cuts, kinks, and collapsed areas of hoses.

(e) the vacuum reservoir for leaks and visual damage.

(f) the entire vacuum system, including indicator lights, gages, horns, bells, pointers or other warning devices, and vacuum level indicators, by attaching a nonporous, clean surface to the vacuum pad or pads and then stopping the vacuum source. The vacuum level in the system shall not decrease by more than the manufacturer’s specified rate.

(g) missing or illegible operating control markings.
20-2.3.4 Periodic Inspection

Complete inspections of the vacuum lifting device shall be performed at intervals as defined in para. 20-2.3.1(b)(3). Any deficiencies, such as listed below, shall be examined, and determination made as to whether they constitute a hazard. These inspections shall include the requirements of para. 20-2.3.3 and, in addition, items such as the following:

(a) external evidence of
   (1) looseness
   (2) wear
   (3) deformation
   (4) cracking
   (5) corrosion
(b) external evidence of damage to
   (1) supporting structure
   (2) motors
   (3) controls
   (4) other auxiliary components
(c) missing or illegible product safety labels required by para. 20-2.2.1(d)

20-2.3.5 Vacuum Lifters Not in Regular Use

A vacuum lifter that has been idle for a period of 1 mo to 1 yr shall be inspected in accordance with para. 20-2.3.3 before being placed in service. A vacuum lifter that has been idle for a period of 1 yr or more shall be inspected in accordance with para. 20-2.3.4 before being returned to service.

20-2.3.6 Inspection Records

Dated inspection reports shall be made on critical items such as those listed in para. 20-2.3.4. Records should be available for each periodic inspection and when the vacuum lifter is either altered or repaired.

20-2.3.7 Repairs

Damage disclosed by the inspection requirements of Section 20-2.3 shall be corrected according to the procedures outlined in para. 20-2.3.9 before operation of the vacuum lifter is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-2.3.8 Testing

20-2.3.8.1 Operational Tests

(a) New and reinstalled lifting devices shall be tested by, or under the direction of, the manufacturer or a qualified person prior to initial use to verify compliance with applicable provisions of this Volume, including, but not limited to, the following:
   (1) moving parts
   (2) latches
   (3) stops
   (4) limit switches
   (5) control devices
   (6) vacuum pad seals
   (7) vacuum lines
(b) Altered or repaired lifting devices shall be tested by a qualified person, or a designated person under the direction of, the manufacturer or a qualified person. This test may be limited to the provision components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.
(c) The seals and connections shall be tested for leaks by attaching a smooth, nonporous, clean material to the vacuum pad or pads and then stopping the vacuum source. Vacuum level in the system shall not decrease by more than the manufacturer’s specified rate.
(d) All indicator lights, gages, horns, bells, pointers, and other warning devices and vacuum level indicators shall be tested by the same method as in para. 20-2.3.8.2 below.
(e) Dated reports of all operational tests shall be filed.

20-2.3.8.2 Load Test

(a) Prior to initial use, all new, altered or repaired vacuum lifting devices shall be load tested and inspected by a qualified person, or a designated person under the direction of, the manufacturer or a qualified person. A written report shall be prepared by the qualified person and placed on file, confirming the load rating of the vacuum lifting device. The load rating should not be more than 80% of the maximum load sustained during the test. Test loads shall not be more than 125% of the rated load of the system, unless otherwise recommended by the manufacturer or a qualified person.
(b) Altered or repaired vacuum lifting devices shall be tested by, or under the direction of, a qualified person.
test may be limited to the components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(c) The load test shall consist of one of the following procedures:

1. Actual Load Test
   (a) Attach pads to the designated test load.
   (b) Raise the test load a minimum distance to ensure the load is supported by the vacuum lifting device.
   (c) Hold the load for 2 min.
   (d) Lower the load for release.

2. Simulated Load Test. Using a test fixture, apply forces to all load-bearing components, either individually or in assemblies, equivalent to the force encountered by the components if they were supporting a load that was 125% of the rated load.
   (d) After the test, the vacuum lifting device shall be visually inspected. Any condition that constitutes a hazard shall be corrected before the lifting device is placed in service. If the correction affects the structure, then the lifter shall be retested.

20-2.3.9 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the vacuum lifting device manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the vacuum lifting device application and operations.

(b) Maintenance Procedure
   (1) Before adjustments and repairs are started on a vacuum lifting device, the following precautions shall be taken:
      (a) Locate the vacuum lifting device where it will cause the least interference with other operations in the area.
      (b) All sources of power shall be disconnected, locked out, and tagged “Out of Service.”
      (c) Relieve fluid pressure from all circuits before loosening or removing fluid power components.
   (2) Only designated personnel shall perform adjustments, repairs and tests when required.
      (a) Provisions should be made for designated persons to work on energized equipment when adjustments and tests are required.
      (b) Lubrication. All moving parts of the vacuum lifting device for which lubrication is specified should be regularly lubricated. The manufacturer’s recommendations as to points and frequency of lubrication, maintenance of lubrication levels, and types of lubricant should be used.
      (c) Adjustments shall be maintained to assure correct functioning of components.
      (d) Repairs or replacements shall be made as needed.
   (3) Replacement parts shall be at least equal to the original manufacturer’s specifications.
   (4) After adjustments and repairs have been made, the vacuum lifting device shall not be returned to service until it has been inspected according to para. 20-2.3.4.
      (5) Dated records of repairs and replacements should be made.

SECTION 20-2.4: OPERATION

20-2.4.1 Operators

Below-the-hook lifting devices shall be operated only by trained, designated persons.

20-2.4.2 Qualifications

Qualifications for operators of below-the-hook lifting devices are as follows:

(a) The operator shall be instructed in the use of the device by a designated person. Instructions should include, but not be limited to, the following:
   (1) application of the lifter to the load and material handling device, and adjustments, if any, that adapt the lifter to various sizes or kinds of loads
   (2) instructions in any special operations or precautions
   (3) the manufacturer’s suggested operating procedures
   (4) condition of the load required for operation of the lifter, such as, but not limited to, balance, surface cleanliness, flatness, bending, and load thickness
   (5) storage of the lifter to protect it from damage
   (6) not exceeding the rated load of the lifting device nor the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and rigging
   (7) charging of the battery (if required)
   (8) the purpose of indicators, meters, or alarms on the vacuum lifter
   (9) the proper attachment of adapters to lifting device for special load handling
(b) The operator shall demonstrate the ability to operate the lifter as instructed before assuming responsibility for using the lifter.
(c) The operator shall demonstrate an understanding of standard hand signals when applicable.
20-2.4.3 Responsibilities

While the organizational structure of various projects may differ, the following roles are described here for purposes of delineating responsibilities. All responsibilities listed below shall be assigned in the worksite organization. (A single individual may perform one or more of these roles.)

operator: directly controls the lifting device’s functions.

owner: has custodial control of a lifting device by virtue of lease or ownership.

These persons and roles may or may not match the persons and roles associated with the hoisting equipment in use.

20-2.4.3.1 Responsibilities of the Lifting Device Owner. The responsibilities of the lifting device owner shall include the following:

(a) providing a lifting device, and all necessary components specified by the manufacturer, that meets the requirements of Sections 20-2.2 and 20-2.3 as well as specific job requirements.

(b) providing all applicable operating instructions.

(c) providing field assembly, and disassembly (if applicable), operation and maintenance information, and warning decals and placards installed as prescribed by the lifting device manufacturer.

(d) establishing an inspection, testing, and maintenance program in accordance with Section 20-2.3.

(e) using designated personnel to perform the required maintenance, repair and inspections.

(f) ensuring that the lifting device is in proper operating condition prior to initial use at the worksite by the following:

(1) verifying that all inspections have been performed as required by Section 20-2.3

(2) verifying that the lifting device has the necessary lifting capacity to perform the proposed lifting operations in the planned configuration

(g) using operators that meet the requirements of paras. 20-2.4.2.

(h) ensuring that all personnel involved in maintenance, repair, assembly, disassembly, and inspection are aware of their responsibilities, assigned duties, and the associated hazards.

(i) determining if additional regulations are applicable to lifting device operations.

(j) ensuring that conditions that may adversely affect lifting device operations are addressed. Such conditions include, but are not limited to, the following:

(1) wind velocity or gusting winds

(2) precipitation

(3) fog

(4) extreme temperatures

(5) lighting

(k) addressing safety concerns raised by the operator or other personnel and being responsible if he and a qualified person decides to overrule those concerns and directs lifting device operations to continue. (In all cases, the manufacturer’s criteria for safe operation and the requirements of this Volume shall be followed.)

20-2.4.3.2 Responsibilities of Operators. The operator shall be responsible for the following listed items. The operator shall not be responsible for hazards or conditions that are not under his direct control and that adversely affect operation of the lifting device. When ever the operator has doubt as to the safety of lifting device operations, the operator shall place the load in a safe condition and stop the lifting device’s functions in a controlled manner. Use of the lifting device shall resume only after safety concerns have been addressed or the continuation of lifting device operations is directed by the owner.

The operator’s responsibilities shall include the following:

(a) reviewing the requirements for the lifting device with the owner before operations.

(b) knowing what types of site conditions could adversely affect the operation of the lifting device and consulting with the owner concerning the possible presence of those conditions.

(c) understanding and applying the information contained in the lifting device manufacturer’s operating manual.

(d) understanding the lifting device’s functions and limitations as well as its particular operating characteristics.

(e) performing an inspection is performed prior to every lift as specified in para. 20-2.3.2.

(f) promptly reporting the need for any adjustments or repairs to a designated person.

(g) following applicable lock out/tag out procedures.

(h) not operating the lifting device when physically or mentally unfit.

(i) ensuring that all controls are in the off or neutral position and that all personnel are in the clear before energizing the lifting device.

(j) not engaging in any practice that will divert his attention while operating the lifting device.

(k) testing the lifting device function controls that will be used and operating the lifting device only if those function controls respond properly.
operating the lifting device’s functions, under normal operating conditions, in a smooth and controlled manner.

knowing and following the procedures specified by the manufacturer or approved by a qualified person, for assembly, disassembly, setting up, and reeving/ rigging of the lifting device.

considering all factors known that might affect the lifting device capacity and informing the owner of the need to make appropriate adjustments.

understanding basic load attachment procedures.

responding only to instructions from designated persons. However, the operator shall obey a stop order at all times, no matter who gives it.

ensuring that all personnel shall stay clear of the load.

20-2.4.4 Lifting Device Operating Practices [Rationale: Global, rigger responsibilities, as applicable for BTH]

(a) Lifting devices shall be operated only by the following qualified personnel:

(1) designated persons

(2) trainees under the supervision of a designated person, the number of trainees permitted to be supervised by a single designated person, the physical location of the designated person while supervising, and the type of communication required between the designated person and the trainee shall be determined by a qualified person.

(3) maintenance and test personnel, when it is necessary in the performance of their duties

(4) inspectors (lifting devices)

(b) Ensure the weight of the load and its approximate center of gravity have been obtained, provided or calculated.

(c) The lifting device shall not be loaded in excess of its rated load or handle any load for which it is not designed.

(d) Properly attaching the lifting device to the hook, shackle, or other load handling device.

(e) The lifter shall be applied to the load in accordance with the instruction manual.

(f) Before lifting, the operator shall make sure that lifter ropes or chains are not kinked, and that multiple part lines are not twisted around each other.

(g) Care should be taken to make certain the load is correctly distributed for the lifter being used.

(h) The temperature of the load should not exceed the maximum allowable limits of the lifter.

(i) The lifter shall be brought over the load in such a manner as to minimize swinging.

(j) Care shall be taken that there is no sudden acceleration or deceleration of the load.

(k) Verify that the operator shall ensure that the load is well secured and properly balanced in the lifting device when it is initially lifted.

(l) Do not allow load or lifter to come into contact with any obstruction.

(m) The operator shall ensure that the lifting device is adequately protected from damage during use.

(n) The operator shall avoid carrying the load over people.

(o) The lifter shall not be used for side pulls or sliding the load unless specifically authorized by a qualified person.

(p) If power goes off while making a lift, the operator shall immediately warn all persons in the vicinity of the lifter and land the load if at all possible to do so.

(q) The vacuum lines shall be free from kinks and twists, and shall not be wrapped around or looped over portions of the lifter that will move during the lift.

(r) The pad contact surface shall be clean and free of loose particles.

(s) Before starting to lift, verify that the vacuum level indicator has reached the required level.

(t) Before starting to lift, raise the load a few inches to establish that the vacuum lifting device has been correctly applied and that a stable vacuum level exists.

(u) The operator shall land any attached load and store the lifter before leaving the lifting device. The operator shall not leave suspended loads unattended.

(v) The operator shall not ride, or allow others to ride loads or the lifting device.

(w) The operation of the lifter shall be observed before during use and during a shift. Any deficiency observed shall be examined by a designated person. If the deficiency constitutes a hazard, the lifter shall be removed from service and tagged “Out of Service.” Any indication of a hazardous condition shall be reported to a qualified person for evaluation.

(x) Loads shall be guided in such a manner as to avoid endangering hands or other body parts as the load is lowered, moved, or if it drops.

20-2.4.5 Miscellaneous Operating Practices

(a) An operator shall not use a lifting device that is tagged “Out of Service” or otherwise designated as nonfunctioning.

(b) “Out of Service” tags on lifting devices shall not be removed without the approval of the person placing them or a designated person.

(c) The lifter, when not in use, should be stored at an assigned location.

(d) Caution should be taken that operating markings or tags shall not be removed or defaced. Missing or illegible markings or tags shall be replaced.
The manufacturer shall provide operating instructions, and maintenance and parts information. In addition, the manual shall also provide a statement of those factors that alter the vacuum lifter’s lifting capacity and related limitations. Several factors known to affect the vacuum lifter’s lifting capacity are noted below.

(a) **Load Rigidity.** The rigidity may cause the vacuum pads and the structure to be loaded unevenly. The rigidity may vary depending on orientation.

(b) **Load Strength.** Stress induced by the load’s own weight and the stress from the vacuum pads may damage the load.

(c) **Load Surface Conditions.** Uneven or rough surfaces may affect the vacuum pad’s ability to attach or maintain a seal. Frictional properties may affect the capacity.

(d) **Load Overhang.** As the load extends past the supports of the vacuum pads, the load may be damaged or deflect and peel away from the pad seal.

(e) **Angle of the Load.** The effect of the coefficient of friction between the load and vacuum pad becomes significant when the load is not horizontal.

(f) **Number of Pads Attached to the Load.** The capacity varies with the number of pads fully attached to the load.

(g) **Load Temperature.** Elevated temperatures may damage the vacuum pads or affect the function of the pads.

(h) **Elevation and Vacuum Level.** The vacuum pad rating varies with the vacuum level achieved under the pads. If the vacuum level decreases from the vacuum level used for capacity calculations, the ultimate pad capacity is reduced. At various elevations, the vacuum level that can be reached may vary.
Chapter 20-3
Close Proximity Operated Lifting Magnets

SECTION 20-3.1: SCOPE

Chapter 20-3 applies to the marking, construction, installation, inspection, testing, maintenance, and operation of all lifting magnets when used for single or multiple steel piece handling operations in which the operator of the lifting magnet is required to manually position the lifting magnet on the load and manually guide the load during its movement, or in remotely operated lifting magnets when operated in close proximity to people. For multi-magnet systems where individual lifting magnets are suspended from a spreader beam or its equivalent, this section applies only to the individual lifting magnet, excluding the spreader beam or its equivalent and the associated control equipment. This Chapter does not apply to remotely operated lifting magnets in areas where people are excluded during normal operation.

(Rationale: unless otherwise noted miscellaneous clean up items and BTH-1 synchronization)

SECTION 20-3.2: MARKING, CONSTRUCTION, AND INSTALLATION

20-3.2.1 Marking

(a) Rated Load (Capacity)

(1) General Application Lifting Magnets. The rated load (capacity) of the lifting magnet shall be legibly marked on the lifting magnet or on a tag attached to the lifting magnet where it is visible. This marking shall refer to the instruction manual for information relating to decreases in rating due to the load surface condition, thickness, percentage of contact with the lifting magnet, temperature, metallurgical composition, and deflection.

(2) Specified Application Lifting Magnets. The rated load (capacity) of the lifting magnet shall be legibly marked on the lifting magnet or on a tag attached to the lifting magnet where it is visible. This marking shall refer to the specific loads for which this rating applies.

(b) Identification. All new Close proximity operated lifting magnets shall be provided with identification displaying, but not limited to, the following information:

(1) manufacturer’s name and contact information
(2) serial number (unique unit identifier)
(3) weight of lifting magnet
(4) duty cycle (when applicable)
(5) the cold current (amps) at 68°F (20°C) (when applicable)
(6) the voltage of the primary power supply or battery (when applicable)
(7) rated load [as described in para. 20-3.2.1(a)]
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class

(c) Repaired or Altered Lifting Magnets. All repaired or altered magnets shall be provided with identification displaying, but not limited to, the following information:

(1) name and address of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) weight of lifting magnet (if altered)
(4) duty cycle (if altered)
(5) the cold current or wattage at 68°F (20°C) (if altered)
(6) the voltage of the primary power supply or battery (if altered)
(7) rated load (if altered) [as described in para. 20-3.2.1(a)]
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(d) Product Safety Labels

(1) Where size and shape of the lifter allow, all lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011, to bring the label to the attention of the operator. The label should include cautionary language identifying hazards, methods of accident prevention, and procedures for safe operation.

(2) Replica Safety Labels

(3) Product Safety Labels
prevention, and refer to Instruction Manuals for additional information.

(2) Where size or shape of lifting magnet prohibits the inclusion of all or any such markings, a label shall be affixed, referring user to consult manufacturer’s instruction manual for product safety information.

(3) Labels on battery operated lifting magnets shall provide additional cautionary language about operating when the battery capacity is inadequate.

(4) Labels on externally powered electromagnets shall contain additional cautionary language against
   (a) exceeding lifting magnet duty cycle
   (b) disconnecting lifting magnet with power on

(5) Labels on electrically controlled permanent magnets shall contain additional cautionary language about operating if the internal control function indicator, where applicable, does not indicate a complete cycle.

(6) Labels on manually controlled permanent magnets shall contain additional precautionary language about operating with the control handle latch not fully in the “attach” position.

(e) Operating Controls. Each control shall be clearly marked describing resulting motion or function of the lifter.

20-3.2.2 Construction

(a) General

(1) Lifting magnet electrical components shall be guarded or located to minimize operator injury or the entry of foreign objects during normal operating conditions.

(2) The control handle of a manually controlled permanent magnet shall include a device that will hold the magnetic circuit in either the “Load” or “Release” position to prevent inadvertent changes.

(3) The manufacturer shall verify that close proximity operated lifting magnets are designed by or under the direct supervision of a qualified person. The design shall be in accordance with ASME BTH-1 and shall consider the stresses resulting from the application of rated load plus the weight of the lifting magnet.

Close proximity lifting magnets shall be designed to ASME BTH-1 Design Category B (static strength criteria) and the proper Service Class (fatigue life criteria) selected for the number of load cycles.

(4) Welding. All welding shall be in accordance with ANSI/AWS D1.4.1 and ASME BTH-1.

(b) Electrical Equipment

(1) External power supply, electrical equipment, and wiring for electromagnets shall comply with ANSI/NFPA 70 and ASME BTH-1.

(2) Control circuit voltage of remote controls shall not exceed 150 V for AC or 300 V for DC.

(c) Lifting Magnet Controllers

(1) All lifting magnet controllers should have voltage and amperage indicated.

(2) Provisions shall be made for guarding the control switch in the “Lift” position to protect it from being inadvertently turned off, if this would result in release of the load.

(3) Battery operated electromagnets shall contain a device indicating existing battery conditions.

(d) Battery Enclosures for Battery Operated Lifting Magnets

Housing for wet cell batteries shall be vented to prevent accumulation of gases.

(e) Battery Backup Systems

Battery backup systems shall have an audible and visible signal to warn the operator when the primary power to the electromagnet is being supplied by the battery(ies).

(f) Power Disconnects

Disconnects are not required on externally powered electromagnets operating from a 120VAC single phase power source.

(1) Hoisting equipment using an externally powered electromagnet shall have a separate magnet circuit switch of the enclosed type with provision for locking, flagging, or tagging in the open (off) position. Means for discharging the inductive energy of the lifting magnet shall be provided. The lifting magnet disconnect switch shall be connected on the line side (power supply side) of the hoisting equipment disconnect switch.

(2) Power supplied to lifting magnets from DC generators can be disconnected by disabling the external powered source connected to the generator, or by providing a circuit switch that disconnects excitation power to the generator and removes all power to the lifting magnet.

(3) Disconnects are not required on externally powered electromagnets operating from a 120 V AC single phase power source.

(g) Alterations

All lifting magnets may be altered or rerated, provided such alterations and the supporting structure are analyzed and approved by the lifting magnet manufacturer or a qualified person. A rerated lifting magnet or one whose load-supporting components have been altered shall conform to para. 20-3.2.2(a)(3) and be tested in accordance with para. 20-3.3.8. New rated load and application load shall be displayed in accordance with para. 20-3.2.1.

(h) Slings, when employed, shall meet the requirements of ASME B30.9.

(i) Hooks, when employed, shall meet the requirements of ASME B30.10.

(j) Rigging hardware, when employed, shall meet the requirements of ASME B30.26.
20-3.2.3 Installation

(a) The lifting magnet shall be installed in accordance with the manufacturer’s instructions.

(b) Determine that the external power input is in accordance with paras. 20-3.2.2(b) and (f), is of the correct voltage and amperage, and that the power conductors and controls are of adequate rating, and insulated and protected against accidental interruption or damage.

20-3.3.1 Inspection Classification

**General.** All inspections shall be performed by a designated person. Any deficiencies identified shall be examined and a determination made by a qualified person as to whether they constitute a hazard, and if so, what additional steps need to be taken to address the hazard. (Rationale: Global, 2014-1, inspections)

Inspection of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with the inspection requirements in the applicable volume.

(a) **Initial Inspection**

(1) New and reinstalled lifting magnets shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.

(2) Altered or repaired lifting magnets shall be inspected. The inspection may be limited to the components affected by the alteration or repair, as determined by a qualified person.

(b) **Inspection Intervals.** Inspection procedures for lifting magnets in regular service are divided into three general classifications, based upon the intervals at which the inspections shall be performed. The intervals, in turn, are dependent upon the nature of the critical components of the lifting magnet and the degree of their exposure to wear, deterioration, or malfunction. The three general classifications are designated as every lift, frequent, and periodic, with respective intervals between inspections as defined below.

(1) **Every Lift Inspection.** Visual examination by the operator before and during each lift made by the lifting magnet.

(2) **Frequent Inspection.** Visual examination by the operator or other designated persons with records not required.

   (a) Normal service — monthly
   (b) Heavy service — weekly to monthly
   (c) Severe service — daily to weekly
   (d) Special or infrequent service — as recommended by a qualified person before and after each lift occurrence

(3) **Periodic Inspection.** Visual inspection making records of apparent external conditions to provide the basis for a continuing evaluation.

   (a) Normal service for equipment in place — yearly
   (b) Heavy service for equipment in place — quarterly, unless external conditions indicate that disassembly should occur to permit detailed inspection
   (c) Severe service [as in (b) above] — monthly
   (d) Special or infrequent service — as recommended by a qualified person before the first lift occurrence and as directed by the qualified person for any subsequent lift occurrences

20-3.3.2 Every Lift Inspection

Items such as the following shall be inspected by the operator before and/or during every lift for any indication of damage as specifically indicated, including observations during operation for any damage that might occur during the lift:

(a) lifting magnet face and surface of the load for foreign materials and smoothness
(b) condition and operation of the control handle of a manually controlled permanent magnet
(c) condition and operation of indicators and meters when installed

20-3.3.3 Frequent Inspection

Items such as the following shall be inspected for damage at intervals as defined in para. 20-3.3.1(b)(2), including observations during operation for any indications of damage that might appear between inspections. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. For all lifting magnets, inspect

(a) structural and suspension members for deformation, cracks, or excessive wear on any part of the lifting magnet
(b) lifting magnet face for foreign materials and smoothness
(c) condition of lifting bail or sling suspension
(d) condition and operation of control handle
(e) condition and operation of indicators and meters, where applicable
(f) for all lifting magnets, except manually controlled permanent magnets, inspect all electrical conductors that are visible without disassembly for loose connections, continuity, corrosion, and damage to insulation
(g) for battery operated electromagnets, inspect for proper level of battery electrolyte and for corrosion of either the battery posts or connectors
(h) cracked housings, welds, and loose bolts
(i) labels and markings
20-3.3.4 Periodic Inspection

Complete inspections of lifting magnets shall be performed and recorded at intervals as defined in para. 20-3.3.1(b)(3). Any deficiencies, such as those listed below, shall be examined by a qualified person and determination made as to whether they constitute a hazard. These inspections shall include the requirements of para. 20-3.3.3 and, in addition, items such as the following:

(a) All members, fasteners, locks, switches, warning labels, and lifting parts shall be inspected for deformation, wear, and corrosion.

(b) All electrical components described in paras. 20-3.2.2(b) through (f), including meters, indicators, or alarms, shall be tested for proper operation and condition.

(c) The lifting magnet coil shall be tested for ohmic and ground readings and compared to manufacturer's standards.

(d) missing or illegible product safety labels required by para. 20-3.2.1(d).

20-3.3.5 Lifting Magnets Not in Regular Use

A lifting magnet that has been idle for a period of 1 mo to 1 yr shall be inspected in accordance with para. 20-3.3.3 before being placed in service. A lifting magnet that has been idle for a period of 1 yr or more shall be inspected in accordance with para. 20-3.3.4 before being returned to service.

20-3.3.6 Inspection Records

Dated inspection reports shall be made on critical items, such as those listed in para. 20-3.3.4. Records should be available for each periodic inspection and when the lifting magnet is either altered or repaired.

20-3.3.7 Repairs

Damage disclosed by the inspection requirements of Section 20-3.3 shall be corrected according to the procedures outlined in para. 20-3.3.9 before operation of the lifting magnet is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-3.3.8 Testing

20-3.3.8.1 Operational Tests

(a) New and reinstalled lifting magnets shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person, prior to initial use to verify compliance with applicable provisions of this Volume, including, but not limited to, the following:

(1) moving parts
(2) latches
(3) stops
(4) switches
(5) any control devices
(6) alarms

(b) Altered or repaired lifting magnets shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person. The test may be limited to the provision components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(c) All indicator lights, gages, horns, bells, alarms, pointers, and other warning devices shall be tested.

(d) Dated reports of all operational tests shall be filed.

20-3.3.8.2 Load Test

(a) Prior to initial use, all new, altered, or repaired lifting magnets shall be tested by, or under the direction of, the manufacturer or a qualified person. The rated load of all lifting components associated with the magnet shall exceed the maximum breakaway force of the magnet to avoid overload, or the components shall not be included in the test. The test results shall be recorded confirming the load rating of the lifting magnet.

(1) General Application lifting magnets shall be required to satisfy the General Application Lifting Magnet breakaway force test.

(a) The rated load for permanent magnet lifters shall be less than 33% of the breakaway force measured in this test.

(b) The rated load for electromagnet lifters shall be less than 50% of the breakaway force measured in this test.

(2) Specified Application lifting magnets shall be required to satisfy the Specified Application Lifting Magnet breakaway force test.

(a) The rated load for permanent magnet lifters shall be less than 33% of the breakaway force measured in this test.
The rated load for electromagnet lifters shall be less than 50% of the breakaway force measured in this test.

Design Factor Test. Close proximity operated lifting magnets should have an annual magnetic design factor test to verify the magnet meets 20-3.3.8.2. This test should be performed to the actual breakaway point of the magnet or may be performed at the calculated minimum breakaway force. The rated load of all components associated with the (magnetic) design factor test shall exceed the maximum breakaway load of the magnet to avoid overload or the lifting hardware shall be removed. Caution should be exercised during the test. The test shall be performed under the direction of a qualified person.

The General Application Lifting Magnet breakaway force test shall establish the force required to vertically remove the lifting magnet from a low carbon, rolled steel plate of the minimum thickness stated by the lifting magnet manufacturer. The portion of this plate that is in contact with the lifting magnet shall have a surface finish of 125 μm (3.2 x 10⁻³ mm) or better and be flat within 0.002 in./ft (0.05 mm/m), without exceeding 0.005 in. (0.127 mm) total. The full operating face of the lifting magnet shall be in contact with the steel plate, which shall be between 60°F (15°C) and 120°F (50°C). The steel plate, load cell or other testing device shall be mounted to allow self alignment so the load is applied to the magnet through the magnet’s center of force.

The Specified Application Lifting Magnet breakaway force test shall establish the breakaway forces of the lifting magnet under the variety of loading conditions for which the lifting magnet is specified. The details of this test should be supplied by the manufacturer of the lifting magnet.

Battery operated electromagnets and externally powered electromagnets shall be operated at the manufacturer’s recommended voltage and current levels.

The test for altered or repaired lifting magnets may be limited to the provision components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

20-3.3.9 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the lifting magnet manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the lifting magnet application and operations.

(b) Maintenance Procedure

(1) Before adjustment and repairs are started on a lifting magnet or its controls, the following precautions shall be taken:

   (a) All sources of lifting magnet power shall be disconnected, locked out, and tagged “Out of Service.”
   (b) A lifting magnet removed for repair shall be tagged “Out of Service.”
   (c) Relieve fluid pressure from all circuits before loosening or removing fluid power components.

(2) Only designated personnel shall work on equipment when adjustments, repairs and tests are required.

(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.

(4) After adjustments and repairs have been made, the lifting magnet shall not be returned to service until it has been inspected according to para. 20-3.3.4.

(5) Dated records of repairs and replacements should be made.

SECTION 20-3.4: OPERATION

20-3.4.1 Operators

Below-the-hook lifting devices shall be operated only by a trained, designated person.

20-3.4.2 Qualifications

Qualifications for operators of below-the-hook lifting devices are as follows:

(a) The operator shall be instructed in the use of the device by a designated person. Instructions should include, but not be limited to, the following:

   (1) application of the lifter to the load and material handling device, and adjustments, if any, that adapt the lifter to various sizes or kinds of loads
   (2) instructions in any special operations or precautions
   (3) the manufacturer’s suggested operating procedures
   (4) condition of the load required for operation of the lifter, such as, but not limited to, balance, surface cleanliness, flatness, bending, and load thickness
   (5) storage of the lifter to protect it from damage
   (6) not exceeding the rated load of the lifting device nor the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and rigging
   (7) charging of the lifting magnet battery (if required)
   (8) the purpose of indicators, meters, or alarms on the lifting magnet
   (9) the proper attachment of adapters to lifting device for special load handling

(b) The operator shall demonstrate the ability to operate the lifter as instructed before assuming responsibility for using the lifter.

(c) The operator shall demonstrate an understanding of standard hand signals when applicable.

20-3.4.3 Responsibilities
While the organizational structure of various projects may differ, the following roles are described here for purposes of delineating responsibilities. All responsibilities listed below shall be assigned in the worksite organization. (A single individual may perform one or more of these roles.)

**operator:** directly controls the lifting device’s functions.

**owner:** has custodial control of a lifting device by virtue of lease or ownership.

These persons and roles may or may not match the persons and roles associated with the hoisting equipment in use.

### 20-3.4.3.1 Responsibilities of the Lifting Device Owner

The responsibilities of the lifting device owner shall include the following:

(a) providing a lifting device, and all necessary components specified by the manufacturer, that meets the requirements of Sections 20-3.2 and 20-3.3 as well as specific job requirements.

(b) providing all applicable operating instructions.

(c) providing field assembly, and disassembly (if applicable), operation and maintenance information, and warning decals and placards installed as prescribed by the lifting device manufacturer.

(d) establishing an inspection, testing, and maintenance program in accordance with Section 20-3.3.

(e) using designated personnel to perform the required maintenance, repair, and inspections.

(f) ensuring that the lifting device is in proper operating condition prior to initial use at the worksite by the following:

1. verifying that all inspections have been performed as required by Section 20-3.3
2. verifying that the lifting device has the necessary lifting capacity to perform the proposed lifting operations in the planned configuration

(g) using operators that meet the requirements of para. 20-3.4.2.

(h) ensuring that all personnel involved in maintenance, repair, assembly, disassembly, and inspection are aware of their responsibilities, assigned duties, and the associated hazards.

(i) determining if additional regulations are applicable to lifting device operations.

(j) ensuring that conditions that may adversely affect lifting device operations are addressed. Such conditions include, but are not limited to, the following:

1. wind velocity or gusting winds
2. precipitation
3. fog
4. extreme temperatures
5. lighting

(k) addressing safety concerns raised by the operator or other personnel and being responsible if he and a qualified person decides to overrule those concerns and directs lifting device operations to continue. (In all cases, the manufacturer’s criteria for safe operation and the requirements of this Volume shall be followed.)

### 20-3.4.3.2 Responsibilities of Operators

The operator shall be responsible for the following listed items. The operator shall not be responsible for hazards or conditions that are not under his direct control and that adversely affect operation of the lifting device. Whenever the operator has doubt as to the safety of lifting device operations, the operator shall place the load in a safe condition and stop the lifting device’s functions in a controlled manner. Use of the lifting device shall resume only after safety concerns have been addressed or the continuation of lifting device operations is directed by the owner.

The operator’s responsibilities shall include the following:

(a) reviewing the requirements for the lifting device with the owner before operations.

(b) knowing what types of site conditions could adversely affect the operation of the lifting device and consulting with the owner concerning the possible presence of those conditions.

(c) understanding and applying the information contained in the lifting device manufacturer’s operating manual.

(d) understanding the lifting device’s functions and limitations as well as its particular operating characteristics.

(e) performing an inspection is performed prior to every lift as specified in para. 20-3.3.2.

(f) promptly reporting the need for any adjustments or repairs to a designated person.

(g) following applicable lock out/tag out procedures.

(h) not operating the lifting device when physically or mentally unfit.

(i) ensuring that all controls are in the off or neutral position and that all personnel are in the clear before attaching the lifting device.

(j) not engaging in any practice that will divert his attention while operating the lifting device.

(k) testing the lifting device function controls that will be used and operating the lifting device only if those function controls respond properly.

(l) operating the lifting device’s functions, under normal operating conditions, in a smooth and controlled manner.

(m) knowing and following the procedures specified by the manufacturer or approved by a qualified person, for assembly, disassembly, setting up, and reeving/ripping of the lifting device.

(n) considering all factors known that might affect the lifting device capacity and informing the owner of the need
to make appropriate adjustments.

(o) understanding basic load attachment procedures.

(p) responding only to instructions from designated persons. However, the operator shall obey a stop order at all times, no matter who gives it.

(q) ensuring that all personnel shall stay clear of the load.

(r) not lifting stacked loads with a permanent magnet unless approved by the manufacturer.

20-3.4.4 Lifting Device Operating Practices [Rationale: Global, rigger responsibilities, as applicable for BTH]

(a) Lifting devices shall be operated only by the following qualified personnel:

(1) designated persons

(2) trainees under the supervision of a designated person, the number of trainees permitted to be supervised by a single designated person, the physical location of the designated person while supervising, and the type of communication required between the designated person and the trainee shall be determined by a qualified person

(3) maintenance and test personnel, when it is necessary in the performance of their duties

(4) inspectors (lifting devices)

(b) Ensure the weight of the load and its approximate center of gravity have been obtained, provided or calculated.

(c) The lifting device shall not be loaded in excess of its rated load or handle any load for which it is not designed.

(d) Properly attaching the lifting device to the hook, shackle, or other load handling device.

(e) The lifter shall be applied to the load in accordance with the instruction manual.

(f) Before lifting, the operator shall make sure that lifter ropes or chains are not kinked and that multiple part lines are not twisted around each other.

(g) Verify that the load is well secured and properly balanced in the lifting device when it is initially lifted

(h) Care should be taken to make certain the load is correctly distributed for the lifter being used.

(i) The temperature of the load should not exceed the maximum allowable limits of the lifter.

(j) The lifter shall be brought over the load in such a manner as to minimize swinging.

(k) Care shall be taken that there is not sudden acceleration or deceleration of the load.

(l) The operator shall ensure that the load is well secured and properly balanced in the lifting device when it is initially lifted.

(m) Do not allow load or lifter to come into contact with any obstruction.

(n) The operator shall ensure that the lifting device is adequately protected from damage during use.

(o) The operator shall avoid carrying the load over people.

(p) The lifter shall not be used for side pulls or sliding the load unless specifically authorized by a qualified person.

(q) The load to be lifted shall be within the lifting magnet’s rated load (capacity) or application load (capacity) and lifting equipment rated load (capacity).

(r) The operator shall observe all meters and indicators on the lifting magnet to confirm proper operation prior to making a lift.

(s) Before starting the lift, the operator shall lift the load a few inches to establish that the load is correctly attached to the lifting magnet.

(p) All Magnets. Before raising the load more than 2 in. (50 mm), any adjustable input control should be switched to the “full power” or “full on” position and remain in this position until the load is removed from the lifting magnet.

(1) Before lifting, the operator shall warn people near the lift.

(2) The operator shall not switch the magnet to the “attach” position until the lifting magnet has been placed in contact with the load to be lifted. Prematurely switching the magnet to the “attach” position could cause unwanted materials to be attracted to the lifting magnet.

(3) The operator shall land any attached load and release the load before leaving the lifting device. The operator shall not leave suspended loads unattended.

(4) The operator shall not ride, or allow others to ride loads or the lifting device.

(5) The operation of the lifter shall be observed during use. Any deficiency observed shall be examined by a designated person. If the deficiency constitutes a hazard, the lifter shall be removed from service and tagged “Out of Service.” Any indication of a hazardous condition shall be reported to a qualified person for evaluation.

(6) Loads shall be guided in such a manner as to avoid endangering hands or other body parts as the load is moved, or if it drops.

(7) When lifting loads that do not absorb all available flux, use caution to avoid lifting multiple loads

(q) Battery Operated Electromagnets

(1) Before lifting, the operator should confirm that the device indicating correct current flow remains stable for a minimum of 5 sec.

(2) For a lift of extended duration, the operator should observe the device indicating existing battery conditions every 5 min.

(3) The operator should open the ventilation lid before charging the battery.

(r) Electrically Controlled Permanent Magnets. Before lifting, the operator should check the internal control function
increases. Consequently, as a lifting magnet’s lifting capacity is a function of this flux, the lift capacity increases with
lifting magnet is to achieve maximum capabilities.

This may create an air gap between the load and the lifting magnet, which reduces the lifting capacity of a lifting magnet. Typical causes of air gaps are: A rough surface finish, paper, dirt, rust, paint, and scale will not increase the magnet lift capacity beyond this level. As loads become thinner than the critical load thickness, the magnet’s lift capacity diminishes since the load cannot transmit all the flux generated by the magnet.

The operator should not reenergize the lifting magnet until it has been placed in contact with the next load to be lifted. Prematurely energizing the lifting magnet could cause unwanted materials to be attracted to the lifting magnet.

The operation of the lifter shall be observed before use and during a shift. Any deficiency observed shall be examined by a designated person. If the deficiency constitutes a hazard, the lifter shall be removed from service and tagged “Out of Service.” Any indication of a hazardous condition shall be reported to a qualified person for evaluation.

Loads shall be guided in such a manner as to avoid endangering hands or other body parts as the load is lowered, or if it drops.

20-3.4.5 Miscellaneous Operating Practices

(a) An operator shall not use a lifting device that is tagged “Out of Service” or otherwise designated as nonfunctioning.

(b) “Out of Service” tags on lifting devices shall not be removed without the approval of the person placing them or a designated person.

(c) The lifter, when not in use, should be stored at an assigned location.

(d) Caution should be taken that operating markings or tags shall not be removed or defaced. Missing or illegible markings or tags shall be replaced.

SECTION 20-3.5: INSTRUCTION MANUALS

The manufacturer shall provide operating instructions, safety precautions, and maintenance and parts information. In addition, the manual shall also provide a statement of those factors that alter the magnet’s lifting capacity and related limitations. Several factors known to affect that magnet’s lifting capacity are noted below.

(a) Load Thickness. The magnetic flux flowing from a lifting magnet into a load increases as the thickness of the load increases. Consequently, as a lifting magnet’s lifting capacity is a function of this flux, the lift capacity increases with load thickness. For every lifting magnet design, there is a critical load thickness where all of the lifting magnet’s available flux flows into the load and the lift capacity reaches maximum. Loads thicker than the critical load thickness will not increase the magnet lift capacity beyond this level. As loads become thinner than the critical load thickness, the magnet’s lift capacity diminishes since the load cannot transmit all the flux generated by the magnet.

(b) Load Alloy. Many alloys of iron do not accept magnetic flux as easily as do low carbon steels. Consequently, loads of such alloys will not accept all of the flux available in the lifting magnet, which reduces the lifting magnet’s lift capacity.

(c) Load Surface Conditions. Anything that creates an air gap or nonmagnetic separation between a lifting magnet and the load reduces the flux flowing from the lifting magnet into the load, which reduces the lifting capacity of a lifting magnet. Typical causes of air gaps are: A rough surface finish, paper, dirt, rust, paint, and scale produce such gaps.

(d) Load Length or Width. As the length or width of the load increases, the load begins to deflect and to peel at the lifting magnet face. This may create an air gap between the load and the lifting magnet, which reduces the lifting capacity per (c) above. The manual shall contain manufacturer’s recommendations pertaining to the maximum load dimensions.

(e) Attitude of Load. As the attitude of the surface of the load to which a lifting magnet is attached (lifting surface) changes from horizontal to vertical, the lifting capacity of the lifting magnet is greatly reduced reaches a minimum and becomes dependent upon the coefficient of friction of the lifting surface.

(f) Portion of Lifting Magnet Face in Contact With Load. The full face of the lifting magnet must contact the load if the lifting magnet is to achieve maximum capabilities.

(g) Load Temperature. The temperature of the load can cause damage to the lifting magnet and, if high enough, even change the magnetic characteristics of the load. Consequently, the manual shall contain the manufacturer’s recommendations pertaining to operation of the lifting magnet on loads at temperatures exceeding normal ambient temperatures.
Chapter 20-4

Remotely Operated Lifting Magnets

(Rationale: unless otherwise noted miscellaneous clean up items and BTH-1 synchronization)

SECTION 20-4.1: SCOPE

Chapter 20-4 applies to the marking, construction, installation, inspection, testing, maintenance, and operation of remotely operated lifting magnets. This Chapter applies to remotely operated lifting magnets in areas where people are excluded during normal operation. This Chapter does not apply to close proximity operated magnets.

SECTION 20-4.2: MARKING, CONSTRUCTION, AND INSTALLATION

20-4.2.1 Marking

(a) Rated Load

(1) General Application Lifting Magnets. The rated load of the lifting magnet shall be legibly marked on the lifting magnet or on a tag attached to the lifting magnet where it is visible. This marking shall refer to the instruction manual for information relating to decreases in rating due to the load surface condition, thickness, percentage of contact with the lifting magnet, temperature, metallurgical composition, and deflection.

(2) Specified Application Lifting Magnets. The rated load of the lifting magnet shall be legibly marked on the lifting magnet or on a tag attached to the lifting magnet where it is visible. This marking shall describe the specific loads for which this rating applies.

(b) Identification. Remotely operated lifting magnets shall be provided with identification displaying, but not limited to, the following information:

(1) manufacturer’s name and contact information
(2) serial number (unique unit identifier)
(3) weight of lifting magnet
(4) duty cycle (when applicable)
(5) the cold current (amps) at 68°F (20°C) (when applicable)
(6) the voltage of the primary power supply or battery (when applicable)
(7) rated load. See para. 20-4.2.1(a)
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class

(c) Repaired or Altered Lifting Magnets. Repaired or altered magnets shall be provided with identification displaying, but not limited to, the following information:

(1) name and contact information of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) weight of lifting magnet (if altered)
(4) duty cycle (if altered)
(5) the cold current or wattage at 68°F (20°C) (if altered)
(6) the voltage of the primary power supply or battery (if altered)
(7) rated load (if altered). See para. 20-4.2.1(a)
(8) ASME BTH-1 Design Category B
(9) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(Rationale: duplicate from other chapters)

(d) Product Safety Labels

(1) Where size and shape of the lifter allow, lifters shall have labels, affixed to them in a readable position, that include the appropriate signal word, according to ANSI Z535.4-2011, to bring the label to the attention of the operator. The label should include cautionary language identifying hazards, methods for accident prevention, and refer to Instruction Manuals for additional information.

(2) Where size or shape of lifting magnet prohibits the inclusion of all or any such markings, a label shall be affixed, referring user to consult manufacturer’s instruction manual for product safety information.

(3) Labels on battery operated lifting magnets shall provide additional cautionary language about operating when the battery capacity is inadequate.

(4) Labels on externally powered electromagnets shall contain additional cautionary language against

(a) exceeding lifting magnet duty cycle

(b) disconnecting lifting magnet with power on
20-4.2.2 Construction

(a) General

(1) Lifting magnet electrical components shall be guarded or located to minimize operator injury or the entry of foreign objects during normal operating conditions.

(2) Lifting magnets should be weather resistant.

(3) Lifting magnet suspension devices should meet the lifting magnet manufacturer’s recommendations.

(4) The manufacturer shall verify that remotely operated lifting magnets are designed by or under the direct supervision of a qualified person. The design shall be in accordance with ASME BTH-1, and shall consider the stresses resulting from the application of rated load plus the weight of the lifting magnet.

Remote operated lifting magnets shall be designed to ASME BTH-1, Design Category B (static strength criteria), and the proper Service Class (fatigue life criteria) selected for its number of load cycles.

(b) Electrical Equipment. External power supply, electrical equipment, and wiring for electromagnets shall comply with ANSI/NFPA 70 and ASME BTH-1.

(1) External power supply, electrical equipment, and wiring for electromagnets shall be in accordance with ANSI/NFPA 70 and ASME BTH-1.

(2) The control circuit voltage of remote controls shall not exceed 150 V for AC or 300 V for DC.

(3) Indication or signal lights should be provided to indicate power is “on” or “off.” If used, the lights shall be located so that they are visible by the operator and from the floor. Multiple bulbs may be used to avoid confusion due to a burned out bulb.

(c) Lifting Magnet Controllers. Lifting magnet controllers should have voltage and amperage indicated (when applicable)

(1) All lifting magnet controllers should have the voltage and amperage indicated.

(2) If the crane is remote controlled, loss of the radio control signal shall not result in deenergizing the lifting magnet.

(d) Power Disconnects. Disconnects are not required on externally powered electromagnets operating from a 120VAC single phase power source.

(1) Hoisting equipment using an externally powered electromagnet shall have a separate magnet circuit switch of the enclosed type, with provision for locking, flagging, or tagging in the open (off) position. Means for discharging the inductive energy of the lifting magnet shall be provided. The lifting magnet disconnect switch shall be connected on the line side (power supply side) of the hoisting equipment disconnect switch.

(2) Power supplied to lifting magnets from DC generators can be disconnected by disabling the external powered source connected to the generator, or by providing a circuit switch that disconnects excitation power to the generator and removes all power to the lifting magnet.

(e) Alterations. All lifting magnets may be altered or rerated, provided such alterations and the supporting structure are analyzed and approved by the lifting magnet manufacturer or a qualified person. A rerated lifting magnet or one whose load-bearing structural components have been altered shall conform to para. 20-4.2.2(a)(4) and be tested in accordance with para. 20-4.3.7.

(f) Slings, when employed, shall meet the requirements of ASME B30.9.

(g) Hooks, when employed, shall meet the requirements of ASME B30.10.

(h) Rigging hardware, when employed, shall meet the requirements of ASME B30.26.

20-4.2.3 Installation

(a) The lifting magnet shall be installed in accordance with the manufacturer’s instructions.

(b) Determine that the external power input is in accordance with paras. 20-4.2.2(b) and (d), is of the correct voltage and amperage, and that the power conductors and controls are of adequate rating, and insulated and protected against accidental interruption or damage.

SECTION 20-4.3: INSPECTION, TESTING, AND MAINTENANCE

20-4.3.1 Inspection Classification

**General.** All inspections shall be performed by a designated person. Any deficiencies identified shall be examined and a determination made by a qualified person as to whether they constitute a hazard, and if so, what additional steps need to be taken to address the hazard. (Rationale: Global, 2014-1, inspections)

Inspection of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with the inspection requirements in the applicable volume.

(a) **Initial Inspection**

- (1) New and reinstalled lifting magnets shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
- (2) Altered or repaired lifting magnets shall be inspected. The inspection may be limited to the components affected by the alteration or repair, as determined by a qualified person.

(b) **Inspection Intervals.** Inspection procedures for lifting magnets in regular service are divided into two general classifications, based upon the intervals at which the inspections shall be performed. The intervals, in turn, are dependent upon the nature of the critical components of the lifting magnet and the degree of their exposure to wear, deterioration, or malfunction. The two general classifications are designated as frequent and periodic, with respective intervals between inspections as defined below.

(1) **Frequent Inspection.** Visual examination by the operator or other designated persons with records not required.

(a) Normal service — monthly
(b) Heavy service — weekly to monthly
(c) Severe service — daily to weekly
(d) Special or infrequent service — as recommended by a qualified person before and after each lift occurrence

(2) **Periodic Inspection.** Visual inspection making records of apparent external conditions to provide the basis for a continuing evaluation.

(a) Normal service for equipment in place — yearly
(b) Heavy service for equipment in place — quarterly, unless external conditions indicate that disassembly should occur to permit detailed inspection
(c) Severe service [as in (b) above] — monthly
(d) Special or infrequent service — as recommended by a qualified person before the first occurrence lift and as directed by the qualified person for any subsequent lift occurrences

20-4.3.2 Frequent Inspection

Items such as the following shall be inspected for damage at intervals as defined in para. 20-4.3.1(b)(1), including observations during operation for any indications of damage that might appear between inspections. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. For all lifting magnets, inspect

(a) structural and suspension members for deformation, cracks, or excessive wear on any part of the lifting magnet
(b) lifting magnet face for foreign materials and smoothness, if applicable
(c) all electrical conductors that are visible without disassembly
(d) cracked housings, Welds, and loose bolts
(e) missing or illegible operating control markings
(f) for battery operated electromagnets, inspect for proper level of battery electrolyte and for corrosion of either the battery posts or connectors

20-4.3.3 Periodic Inspection

Complete inspections of lifting magnets shall be performed and recorded at intervals as defined in para. 20-4.3.1(b)(2). Any deficiencies, such as those listed below, shall be examined by a qualified person and determination made as to whether they constitute a hazard. These inspections shall include the requirements of para. 20-4.3.2 and, in addition, items such as the following:

(a) All members, fasteners, and lifting parts shall be inspected for deformation, wear, and corrosion.
(b) All electrical components described in para. 20-4.2.2, including meters, indicators, or alarms, shall be tested for proper operation and condition.
(c) The lifting magnet coil shall be tested for ohmic and ground readings, and compared to manufacturer’s standards.
(d) missing or illegible product safety labels required by para. 20-4.2.1(d).

20-4.3.4 Lifting Magnets Not in Regular Use

A lifting magnet that has been idle for a period of 1 mo to 1 yr shall be inspected in accordance with para. 20-4.3.2 before being placed in service. A lifting magnet that has been idle for a period of 1 yr or more shall be
inspected in accordance with para. 20-4.3.3 before being returned to service.

20-4.3.5 Inspection Records

Dated inspection reports shall be made on critical items, such as those listed in para. 20-4.3. Records should be available for each periodic inspection and when the lifting magnet is either altered or repaired.

20-4.3.6 Repairs

Damage disclosed by the inspection requirements of Section 20-4.3 shall be corrected according to the procedures outlined in para. 20-4.3.8 before operation of the lifting magnet is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-4.3.7 Testing

20-4.3.7.1 Operational Tests

(a) New and reinstalled lifting magnets shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person, prior to initial use to verify compliance with applicable provisions of this Volume, including, but not limited to, the following:

(1) moving parts
(2) latches
(3) stops
(4) switches
(5) any control devices
(6) alarms
(7) indicator lights, gages, horns, bells, alarms, pointers, and other warning devices

(b) Altered or repaired lifting magnets shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person. The test may be limited to the components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(a) Prior to initial use, all new, altered, or repaired lifting magnets shall be tested by, or under the direction of, a qualified person, to verify compliance with applicable provisions of this Volume, including, but not limited to, the following:

(1) visual inspection to verify that the lifting magnet contains no visible indications of hazardous conditions
(2) a check for proper operation of all electrical equipment contained in para. 20-4.2.2

(b) The test for altered or repaired lifting magnets may be limited to the provisions affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(c) All indicator lights, gages, horns, bells, alarms, pointers, and other warning devices shall be tested.

(d) Dated reports of all operational tests shall be filed.

20-4.3.7.2 Load Test

(a) Prior to initial use, all new, altered, or repaired lifting magnets shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person. The rated load for all components associated with the magnet shall meet the maximum breakaway force of the magnet to avoid overload or the components shall not be included in the test. The test results shall be recorded confirming the load rating of the lifting magnet.

(1) General Application lifting magnets shall be required to satisfy the General Application Lifting Magnet breakaway force test.

(a) The rated load for permanent magnet lifters shall be less than 33% of the breakaway force measured in this test.

(b) The rated load for electromagnet lifters shall be less than 50% of the breakaway force measured in this test.

(2) Specified Application lifting magnets shall be required to satisfy the Specified Application Lifting Magnet breakaway force test.

(a) The rated load for permanent magnet lifters shall be less than 33% of the breakaway force measured in this test.

(b) The rated load for electromagnet lifters shall be less than 50% of the breakaway force measured in this test.

(3) Design Factor Test. Remote operated lifting magnets should have an annual magnetic design factor test to verify the magnet meets 20-4.3.7.2.a.1 or 20-4.3.7.2.a.2. This test should be performed to the actual breakaway point of the magnet or may be performed at the calculated minimum breakaway force. The rated load of lifting hardware associated with the magnetic design factor test shall exceed the maximum breakaway load of the magnet to avoid overload or the lifting hardware shall be removed. Caution should be applied during the test. The test shall be performed under the direction of a qualified person.

(b) The General Application Lifting Magnet breakaway force test shall establish the force required to vertically remove the lifting magnet from a low carbon, rolled steel plate of the minimum thickness stated by the lifting magnet manufacturer. The portion of this plate that is in contact with the lifting magnet shall have a
surface finish of 125 µ in. (3.2 × 10⁻³ mm) or better and be flat within 0.002 in./ft (0.05 mm/30 cm), without exceeding 0.005 in. (0.127 mm) total. The full operating face of the lifting magnet shall be in contact with the steel plate, which shall be between 60°F (15°C) and 120°F (50°C). The steel plate, load cell or other testing device shall be mounted to allow self alignment so the load is applied to the magnet through the magnet’s center of force.

(c) The Specified Application Lifting Magnet breakaway force test shall establish the breakaway forces of the lifting magnet under the variety of loading conditions for which the lifting magnet is specified. The details of this test should be supplied by the manufacturer of the lifting magnet.

(d) Battery operated electromagnets and externally powered electromagnets shall be operated at the manufacturer’s recommended voltage and current levels.

(e) The test for altered or repaired lifting magnets may be limited to the components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

20-4.3.8 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the lifting magnet manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the lifting magnet application and operations.

(b) Maintenance Procedure

(1) Before adjustments and repairs are started on a lifting magnet or its controls, the following precautions shall be taken:

(a) All sources of lifting magnet power shall be disconnected, locked out, and tagged “Out of Service.”

(b) A lifting magnet removed from service for repair shall be tagged “Out of Service.”

(c) Relieve fluid pressure from all circuits before loosening or removing fluid power components.

(2) Only designated personnel shall work on equipment when maintenance, repairs and tests are required.

(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.

(4) After adjustments and repairs have been made, the lifting magnet shall not be returned to service until it has been inspected according to para. 20-4.3.3.

(5) Dated records of repairs and replacements should be made.

SECTION 20-4.4: OPERATION

20-4.4.1 Operators

Below-the-hook lifting devices shall be operated only by trained, designated persons.

20-4.4.2 Qualifications

Qualifications for operators of below-the-hook lifting devices are as follows:

(a) The operator shall be instructed in the use of the device by a designated person before operating the device. Instructions should include, but not be limited to, the following:

1. application of the lifter to the load and material handling device, and adjustments, if any, that adapt the lifter to various sizes or kinds of loads
2. instructions in any special operations or precautions
3. the manufacturer’s suggested operating procedures
4. condition of the load required for operation of the lifter, such as, but not limited to, balance, surface cleanliness, flatness, bending, and load thickness
5. storage of the lifter to protect it from damage
6. not exceeding the rated load of the lifting device nor the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and rigging
7. charging of the lifting magnet battery (if required)
8. the purpose of indicators, meters, or alarms on the lifting magnet
9. the proper attachment of adapters to lifting device for special load handling

(b) the operator shall demonstrate the ability to operate the lifter as instructed before assuming responsibility for using the lifter.

(c) The operator shall demonstrate an understanding of standard hand signals when applicable.

20-4.4.3 Responsibilities

While the organizational structure of various projects may differ, the following roles are described here for purposes of delineating responsibilities. All responsibilities listed below shall be assigned in the worksite organization. (A single individual may perform one or more of these roles.)

operator: directly controls the lifting device’s functions.

owner: has custodial control of a lifting device by virtue of lease or ownership.

These persons and roles may or may not match the persons and roles associated with the hoisting equipment in use.

20-4.4.3.1 Responsibilities of the Lifting Device Owner. The responsibilities of the lifting device owner shall include
the following:

(a) providing a lifting device, and all necessary components specified by the manufacturer, that meets the requirements of Sections 20-4.2 and 20-4.3 as well as specific job requirements.

(b) providing all applicable operating instructions.

(c) providing field assembly, and disassembly (if applicable), operation and maintenance information, and warning decals and placards installed as prescribed by the lifting device manufacturer.

(d) establishing an inspection, testing, and maintenance program in accordance with Section 20-4.3.

(e) using designated personnel to perform the required maintenance, repair and inspections.

(f) ensuring that the lifting device is in proper operating condition prior to initial use at the worksite by the following:

(1) verifying that all inspections have been performed as required by Section 20-4.3.

(2) verifying that the lifting device has the necessary lifting capacity to perform the proposed lifting operations in the planned configuration.

(g) using operators that meet the requirements of paras. 20-4.4.2.

(h) ensuring that all personnel involved in maintenance, repair, assembly, disassembly, and inspection are aware of their responsibilities, assigned duties, and the associated hazards.

(i) determining if additional regulations are applicable to lifting device operations.

(j) ensuring that conditions that may adversely affect lifting device operations are addressed. Such conditions include, but are not limited to, the following:

(1) wind velocity or gusting winds

(2) precipitation

(3) fog

(4) extreme temperatures

(5) lighting

(k) addressing safety concerns raised by the operator or other personnel and being responsible if he and a qualified person decides to overrule those concerns and directs lifting device operations to continue. (In all cases, the manufacturer’s criteria for safe operation and the requirements of this Volume shall be followed.)

20-4.4.3.2 Responsibilities of Operators. The operator shall be responsible for the following listed items. The operator shall not be responsible for hazards or conditions that are not under his direct control and that adversely affect operation of the lifting device. When-ever the operator has doubt as to the safety of lifting device operations, the operator shall place the load in a safe condition and stop the lifting device’s functions in a controlled manner. Use of the lifting device shall resume only after safety concerns have been addressed or the continuation of lifting device operations is directed by the owner.

The operator’s responsibilities shall include the following:

(a) reviewing the requirements for the lifting device with the owner before operations.

(b) knowing what types of site conditions could adversely affect the operation of the lifting device and consulting with the owner concerning the possible presence of those conditions.

(c) understanding and applying the information contained in the lifting device manufacturer’s operating manual.

(d) understanding the lifting device’s functions and limitations as well as its particular operating characteristics.

(e) performing a Frequent Inspection as specified in para. 20-4.3.2.

(f) promptly reporting the need for any adjustments or repairs to a designated person.

(g) following applicable lock out/tag out procedures.

(h) not operating the lifting device when physically or mentally unfit.

(i) ensuring that all controls are in the off or neutral position and that all personnel are in the clear before energizing the lifting device.

(j) not engaging in any practice that will divert his attention while operating the lifting device.

(k) testing the lifting device function controls that will be used and operating the lifting device only if those function controls respond properly.

(l) operating the lifting device’s functions, under normal operating conditions, in a smooth and controlled manner.

(m) knowing and following the procedures specified by the manufacturer or approved by a qualified person, for assembly, disassembly, setting up, and reeving/ rigging of the lifting device.

(n) considering all factors known that might affect the lifting device capacity and informing the owner of the need to make appropriate adjustments.

(o) understanding basic load attachment procedures.

(p) responding only to instructions from designated persons. However, the operator shall obey a stop order at all times, no matter who gives it.

(q) ensuring that all personnel shall stay clear of the load.

(r) not lifting stacked loads with a permanent magnet unless approved by the manufacturer.

20-4.4.4 Lifting Device Operating Practices (Rationale: Global, rigger responsibilities, as applicable for BTH)

(a) Lifting devices shall be operated only by the following personnel:

(1) designated persons
(2) trainees under the supervision of a designated person, the number of trainees permitted to be supervised by a single designated person, the physical location of the designated person while supervising, and the type of communication required between the designated person and the trainee shall be determined by a qualified person.

(3) maintenance and test personnel, when it is necessary in the performance of their duties

(4) inspectors (lifting devices)

(b) Ensure the weight of the load and its approximate center of gravity have been obtained, provided or calculated.

(d) Properly attaching the lifting device to the hook, shackle, or other load handling device.

(e) The lifter shall be applied to the load in accordance with the instruction manual.

(f) Before lifting, the operator shall make sure that lifter ropes or chains are not kinked and that multiple part lines are not twisted around each other.

(g) Verify that the load is well secured and properly balanced in the lifting device when it is initially lifted.

(h) Care should be taken to make certain the load is correctly distributed for the lifter being used.

(i) The temperature of the load should not exceed the maximum allowable limits of the lifter.

(j) The lifter shall be brought over the load in such a manner as to minimize swinging.

(k) Care shall be taken that there is not sudden acceleration or deceleration of the load.

(l) Do not allow load or lifter to come into contact with any obstruction.

(m) The operator shall ensure that the lifting device is adequately protected from damage during use.

(n) The operator shall avoid carrying the load over people.

(o) The lifter shall not be used for side pulls or sliding the load unless specifically authorized by a qualified person.

(p) The operator shall land any attached load and store the lifter before leaving the lifting device. The operator shall not leave suspended loads unattended.

(q) The operator shall not ride, or allow others to ride loads or the lifting magnet.

(r) The operation of the lifter shall be observed before during use and during a shift. Any deficiency observed shall be examined by a designated person. If the deficiency constitutes a hazard, the lifter shall be removed from service and tagged “Out of Service.” Any indication of a hazardous condition shall be reported to a qualified person for evaluation.

(s) When lifting loads that do not absorb all available flux, use caution to avoid lifting multiple loads.

20-4.4.5 Miscellaneous Operating Practices

(a) An operator shall not use a lifting device that is tagged “Out of Service” or otherwise designated as nonfunctioning.

(b) “Out of Service” tags on lifting devices shall not be removed without the approval of the person placing them or a designated person.

(c) The lifter, when not in use, should be stored at an assigned location.

(d) Caution should be taken that operating markings or tags shall not be removed or defaced. Missing or illegible markings or tags shall be replaced.

SECTION 20-4.5: INSTRUCTION MANUALS

The manufacturer shall provide operating instructions, safety precautions and maintenance and parts information. In addition, the manual shall also provide a statement of those factors that alter the lifting magnet’s lifting capacity and related limitations. Several key factors known to affect the magnet’s lifting capacity are noted below.

(a) Load Thickness. For every lifting magnet design, there is a critical load thickness where all of the lifting magnet’s available flux flows into the load and the magnet’s lift capacity reaches maximum. Loads thicker than the critical load thickness will not increase the magnet lift capacity beyond this level. As loads become thinner than the critical load thickness, the magnet’s lift capacity diminishes since the load cannot transmit all the flux generated by the magnet. The magnetic flux flowing from a lifting magnet into a load increases as the thickness of the load increases. Consequently, as a lifting magnet’s lifting capacity is a function of this flux, the lift capacity increases with load thickness. For every lifting magnet, there is a critical load thickness where all of the lifting magnet’s available flux flows into the load and the lift capacity reaches maximum.

(b) Load Alloy. Many alloys of iron do not accept magnetic flux as easily as do low carbon steels. Consequently, loads of such alloys will not accept all of the flux available in the lifting magnet, which reduces the lifting magnet’s lift capacity.

(c) Load Surface Conditions. Anything that creates an air gap or nonmagnetic separation between a lifting magnet and the load reduces the flux flowing from the lifting magnet into the load, which reduces the lifting capacity of a lifting magnet. Typical causes of air gaps are: A rough surface finish, paper, dirt, rust, paint, and scale produce such gaps.

(d) Load Length or Width. As the length or width of the load increases, the load begins to deflect and to peel at the lifting magnet face. This may create an air gap between the load and the lifting magnet, which reduces the lifting capacity per (c) above. The manual shall contain manufacturer’s recommendations pertaining to the maximum load dimensions for a particular lifting magnet.

(e) Attitude of Load. As the attitude of the surface of the load to which a lifting magnet is attached (lifting face) changes from horizontal to vertical, the lifting capacity of the lifting magnet is greatly reduced, reaches a minimum
and becomes dependent upon the coefficient of friction of the lifting surface.

(f) **Portion of Lifting Magnet Face in Contact With Load.** The full face of the lifting magnet must contact the load if the lifting magnet is to achieve maximum capabilities.

(g) **Load Temperature.** The temperature of the load can cause damage to the lifting magnet and, if high enough, even change the magnetic characteristics of the load. Consequently, the manual shall contain the manufacturer’s recommendations pertaining to operation of the lifting magnet on loads at temperatures exceeding normal ambient temperatures.
Chapter 20-5
Scrap and Material-Handling
Grapples

SECTION 20-5.1: SCOPE

Chapter 20-5 applies to the marking, construction, installation, inspection, testing, maintenance, and operation of hydraulically operated scrap and material-handling grapples.

(Rationale: unless otherwise noted miscellaneous clean up items and BTH-1 synchronization)

SECTION 20-5.2: MARKING, CONSTRUCTION, AND INSTALLATION

20-5.2.1 Marking

(a) Identification. All new scrap and material-handling grapples shall be marked with, but not limited to, the following information:

(1) manufacturer’s name and contact information address
(2) serial number (unique unit identifier)
(3) grapple weight
(4) rated voltage (when applicable)
(5) operating hydraulic pressure(s)
(6) rated load
(7) ASME BTH-1 Design Category B
(8) ASME BTH-1 Service Class

(b) Repaired or Altered Grapples. All repaired or altered scrap and material handling grapples shall be provided with identification displaying, but not limited to, the following information:

(1) name and contact information address of the repairer or alterer
(2) repairer’s or alterer’s unit identification
(3) grapple weight (if altered)
(4) operating hydraulic pressure(s) (if altered)
(5) rated voltage (if altered)
(6) rated load (if altered)
(7) ASME BTH-1 Design Category B
(8) ASME BTH-1 Service Class (if altered)

This requirement is not applicable to repairs limited to replacement of maintenance parts.

(c) Operating Controls. Each control shall be clearly marked describing resulting motion or function of the lifter (if altered).

20-5.2.2 Construction

(a) General. The manufacturer shall verify that scrap and material handling grapples are designed by or under the direct supervision of a qualified person. The design shall be in accordance with ASME BTH-1 and shall consider the stresses resulting from the application of rated load plus the weight of the material handling grapple.

Scrap and material handling grapples shall be designed to ASME BTH-1 Design Category B (static strength criteria) and the proper Service Class (fatigue life criteria) selected for the number of load cycles.

(b) Welding. All welding shall be in accordance with ANSI/AWS D14.1 and ASME BTH-1, 14.6.

(c) Electrical Equipment. External power supply, electrical equipment, and wiring for below the hook lifters shall be in accordance with ASME BTH-1 Electrical equipment and wiring shall comply with ANSI/NFPA 70 and ASME BTH-1.

(d) Grapple Magnets. Lifting magnet construction shall comply with para. 20-4.2.2.

(e) Alterations. Grapples may be altered or rerated, provided such modifications are analyzed and approved by the equipment manufacturer or a qualified person. A rerated grapple or one whose components have been altered shall be tested according to para. 20-5.3.7. New rated capacity shall be displayed in accordance with para. 20-5.2.1(b).

(f) Slings, when employed, shall meet the requirements of ASME B30.9.

(g) Hooks, when employed, shall meet the requirements of ASME B30.10.

(h) Rigging hardware, when employed, shall meet the requirements of ASME B30.26.
The grapple shall be installed in accordance with the manufacturer’s instructions.  

(b) The user shall confirm that the hydraulic flows and pressures are the same as indicated on the grapple nameplate.

(c) Determine that the external power input is in accordance with para. 20-4.2.2(b), and is of the correct voltage and amperage.

(d) Confirm that the electrical power conductors and controls are of adequate rating, and insulated and protected against inadvertent interruption or damage.
Fig. 20-5.1-1 Scrap and Material-Handling Grapples

(b) Electrohydraulic Grapple
(c) Three-in-One Grapple
(d) Magnet Grapple
(e) Car Body Grapple
20-5.3.1 Inspection Classification

General. All inspections shall be performed by a designated person. Any deficiencies identified shall be examined and a determination made by a qualified person as to whether they constitute a hazard, and if so, what additional steps need to be taken to address the hazard. (Rationale: Global, 2014-1, inspections)

Inspection of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with the inspection requirements in the applicable volume.

(a) Initial Inspection

(1) New and reinstalled grapples shall be inspected prior to initial use to verify compliance with applicable provisions of this Volume.
(2) Altered or repaired grapples shall be inspected. The inspection may be limited to the provision components affected by the alteration or repair, as determined by a qualified person.

(b) Inspection Intervals. Inspection procedures for grapples in regular service are divided into two general classifications, based upon the intervals at which the inspections shall be performed. The intervals, in turn, are dependent upon the nature of the critical components of the grapple and the degree of their exposure to wear, deterioration, or malfunction. The two general classifications are designated as frequent and periodic, with respective intervals between inspections as defined below.

(1) Frequent Inspection. Visual examination by the operator or other designated persons with records not required.
(a) Normal service — monthly
(b) Heavy service — weekly to monthly
(c) Severe service — daily to weekly
(d) Special or infrequent service — as recommended by a qualified person before and after each lift occurrence

(2) Periodic Inspection. Visual inspection making records of apparent external conditions to provide the basis for a continuing evaluation.
(a) Normal service for equipment in place — yearly
(b) Heavy service for equipment in place — quarterly, unless external conditions indicate that disassembly should be done to permit detailed inspection
(c) Severe service for equipment in place — monthly, unless external conditions indicate that disassembly should be done to permit detailed inspection
(d) Special or infrequent service — as recommended by a qualified person before the first occurrence, lift, and as directed by the qualified person for any subsequent lift occurrences

20-5.3.2 Frequent Inspection

Items such as the following shall be inspected for damage at intervals as defined in para. 20-5.3.1(b)(1), including observations during operation for any indications of damage that might appear between inspections. A qualified person shall determine whether any indications of damage constitute a hazard or will require more frequent inspection. For all grapples, inspect
(a) structural members for deformation, cracks, or excessive wear on any part of the grapple
(b) pins and bushings
(c) hydraulic lines
(d) hydraulic cylinders
(e) loose bolts
(f) for combination magnet/grapples, inspect the lifting magnet per para. 20-4.3.2
(g) for electrohydraulic grapples, inspect all electrical conductors that are visible without disassembly
(h) missing or illegible operating control markings

20-5.3.3 Periodic Inspection

Complete inspections of grapples shall be performed and recorded at intervals as defined in para. 20-5.3.1(b)(2). Any deficiencies, such as those listed below, shall be examined by a qualified person and determination made as to whether they constitute a hazard. These inspections shall include the requirements of para. 20-5.3.2 and, in addition, items such as the following:
(a) all members, fasteners, and lifting parts shall be inspected for deformation, wear, and corrosion
(b) hydraulic hose, fittings, and tubing inspection
(1) evidence of leakage at the surface of flexible hose or its junction with metal couplings
(2) blistering or abnormal deformation of the outer covering of the hydraulic hose
(3) leakage at threaded or clamped joints that cannot be eliminated by normal tightening or recommended procedures
(4) evidence of excessive abrasion or scrubbing on the outer surface of a hose, rigid tube, or fitting
(c) hydraulic motors
(1) loose bolts or fasteners
(2) leaks at joints between sections
(3) shaft seal leaks
(4) unusual noises or vibration
(5) loss of operating speed
(6) excessive heating of the fluid
(7) loss of pressure
(d) hydraulic cylinders
(1) drifting caused by fluid leaking across the piston seals
(2) rod seal leakage
(3) leaks at welded joints
(4) scored, nicked, or dented cylinder rods
(5) dented case (barrel)
(6) loose or deformed rod eyes or connecting joints
(e) for combination magnet/grapples, inspect the magnet per para. 20-4.3.3
(f) for electrohydraulic grapples, all electrical components, including meters, indicators, and alarms, shall be tested for proper operation and condition

20-5.3.4 Grapples Not in Regular Use

A grapple that has been idle for a period of 1 mo to 1 yr shall be inspected in accordance with para. 20-5.3.2 before being placed in service. A grapple that has been idle for a period of 1 yr or more shall be inspected in accordance with para. 20-5.3.3 before being returned to service.

20-5.3.5 Inspection Records

Dated inspection reports shall be made on critical items such as those listed in para. 20-5.3.3. Records should be available for each periodic inspection and when the grapple is either altered or repaired.

20-5.3.6 Repairs

Damage disclosed by the inspection requirements of Section 20-5.3 shall be corrected according to the procedures outlined in para. 20-5.3.8 before normal operation of the grapple is resumed, unless a qualified person determines the damage does not constitute a hazard. Repairs of slings (ASME B30.9), hooks (ASME B30.10), rigging hardware (ASME B30.26), or other special devices shall comply with repair requirements in the applicable volumes or standards.

20-5.3.7 Testing

(a) New and reinstalled grapples shall be tested by a qualified person, or a designated person under the direction of, the manufacturer or a qualified person prior to initial use, to verify compliance with applicable provisions of this Volume, including a visual inspection to verify that the grapple contains no visible indications of hazardous conditions.

(b) Altered or repaired grapples shall be tested by a qualified person, or a designated person under the direction of the manufacturer or a qualified person. This test may be limited to the provision components affected by the alteration or repair, as determined by a qualified person with guidance from the manufacturer.

(c) All indicator lights, gages, horns, bells, alarms, pointers, and other warning devices shall be tested.

(d) Dated reports of all operational tests shall be filed.

20-5.3.8 Maintenance

(a) Maintenance Program. A maintenance program shall be established and be based on recommendations made by the grapple manufacturer. If a qualified person determines it is appropriate, the program should also include that individual’s additional recommendations based on a review of the grapple application and operations.

(b) Maintenance Procedure

(1) Before maintenance is started on a grapple or its controls, the following precautions shall be taken:
   (a) all sources of grapple power shall be disconnected, locked out, and tagged “Out of Service”
   (b) relieve fluid pressure shall from all circuits before loosening or removing fluid power components
   (c) a grapple removed from service for repair shall be tagged “Out of Service”

(2) Only designated personnel shall perform maintenance, repairs and tests when required. All moving parts of the grapple for which lubrication is specified should be regularly lubricated. The manufacturer’s recommendations as to the points and frequency of lubrication, and types of lubricant, should be used.

(3) Replacement parts shall be at least equal to the original manufacturer’s specifications.

(4) After adjustments and repairs have been made, the grapple shall not be returned to service until it has been inspected according to para. 20-5.3.3.

(5) Dated records of repairs and replacements should be made.
SECTION 20-5.4: OPERATION

20-5.4.1 Operators

Grapples shall be operated only by trained, designated persons.

20-5.4.2 Qualifications

Qualifications for operators of grapples are as follows:

(a) The operator shall be instructed in the use of the grapple by a designated person before operating the grapple. Instructions should include, but not be limited to, the following:

(1) instructions in any special operations or precautions
(2) the manufacturer’s suggested operating procedures
(3) storage of the grapple to protect it from damage
(4) not exceeding the rated load of the grapple nor the material handler by the combined weight of the grapple and the load

(b) The operator shall demonstrate the ability to operate the grapple as instructed before assuming responsibility for using the grapple.

(c) The operator shall demonstrate an understanding of standard hand signals when applicable.

20-5.4.3 Responsibilities

While the organizational structure of various projects may differ, the following roles are described here for purposes of delineating responsibilities. All responsibilities listed below shall be assigned in the worksite organization. (A single individual may perform one or more of these roles.)

operator: directly controls the lifting device’s functions.

owner: has custodial control of a lifting device by virtue of lease or ownership.

These persons and roles may or may not match the persons and roles associated with the hoisting equipment in use.

20-5.4.3.1 Responsibilities of the Lifting Device Owner. The responsibilities of the lifting device owner shall include the following:

(a) providing a lifting device, and all necessary components specified by the manufacturer, that meets the requirements of Sections 20-5.2 and 20-5.3 as well as specific job requirements.

(b) providing all applicable operating instructions.

(c) providing field assembly, and disassembly (if applicable), operation and maintenance information, and warning decals and placards installed as prescribed by the lifting device manufacturer.

(d) establishing an inspection, testing, and maintenance program in accordance with Section 20-5.3.

(e) using designated personnel to perform the required maintenance, repair and inspections.

(f) ensuring that the lifting device is in proper operating condition prior to initial use at the worksite by the following:

(1) verifying that all inspections have been performed as required by Section 20-5.3

(2) verifying that the lifting device has the necessary lifting capacity to perform the proposed lifting operations in the planned configuration

(g) using operators that meet the requirements of para. 20-5.4.2.

(h) ensuring that all personnel involved in maintenance, repair, assembly, disassembly, and inspection are aware of their responsibilities, assigned duties, and the associated hazards.

(i) determining if additional regulations are applicable to lifting device operations.

(j) ensuring that conditions that may adversely affect lifting device operations are addressed. Such conditions include, but are not limited to, the following:

(1) wind velocity or gusting winds
(2) precipitation
(3) fog
(4) extreme temperatures
(5) lighting

(k) addressing safety concerns raised by the operator or other personnel and being responsible if he decides to overrule those concerns and directs lifting device operations to continue. (In all cases, the manufacturer’s criteria for safe operation and the requirements of this Volume shall be followed.)

20-5.4.3.2 Responsibilities of Operators. The operator shall be responsible for the following listed items. The operator shall not be responsible for hazards or conditions that are not under his direct control and that adversely affect operation of the lifting device. When ever the operator has doubt as to the safety of lifting device operations, the operator shall place the load in a safe condition and stop the lifting device’s functions in a controlled manner. Use of the lifting device shall resume only after safety concerns have been addressed or the continuation of lifting device operations is directed by the owner.
The operator’s responsibilities shall include the following:

(a) reviewing the requirements for the lifting device with the owner before operations.
(b) knowing what types of site conditions could adversely affect the operation of the lifting device and consulting with the owner concerning the possible presence of those conditions.
(c) understanding and applying the information contained in the lifting device manufacturer’s operating manual.
(d) understanding the lifting device’s functions and limitations as well as its particular operating characteristics.
(e) performing a Frequent Inspection as specified in para. 20-5.3.2.
(f) promptly reporting the need for any adjustments or repairs to a designated person.
(g) following applicable lock out/tag out procedures.
(h) not operating the lifting device when physically or mentally unfit.
(i) ensuring that all controls are in the off or neutral position and that all personnel are in the clear before energizing the lifting device.
(j) not engaging in any practice that will divert his attention while operating the lifting device.
(k) testing the lifting device function controls that will be used and operating the lifting device only if those function controls respond properly.
(l) operating the lifting device’s functions, under normal operating conditions, in a smooth and controlled manner.
(m) knowing and following the procedures specified by the manufacturer or approved by a qualified person, for assembly, disassembly, setting up, and reeving/rigging of the lifting device.
(n) considering all factors known that might affect the lifting device capacity and informing the owner of the need to make appropriate adjustments.
(o) understanding basic load attachment procedures.
(p) responding only to instructions from designated persons. However, the operator shall obey a stop order at all times, no matter who gives it.

20-5.4.4 Grapple Operating Practices (Rationale: Global, rigger responsibilities, as applicable for BTH)

(a) Grapples shall be operated by the following qualified personnel:
   (1) designated persons
   (2) trainees under the supervision of a designated person, the number of trainees permitted to be supervised by a single designated person, the physical location of the designated person while supervising, and the type of communication required between the designated person and the trainee shall be determined by a qualified person
   (3) maintenance and test personnel, when it is necessary in the performance of their duties
(b) The grapple shall not be loaded in excess of its rated load or handle any load for which it is not designed.
(c) Properly attaching the lifting device to the hook, shackle, or other load handling device.
(d) The temperature of the load shall not exceed the maximum allowable limits of the grapple.
(e) The grapple shall be brought over the load in such a manner as to minimize swinging.
(f) Do not allow load or grapple to come into contact with any obstruction.
(g) The operator shall ensure that the lifting device is adequately protected from damage during use.
(h) The operator shall avoid carrying the load over people.
(i) The operator shall land any attached load and store the lifter before leaving the lifting device. The operator shall not leave suspended loads unattended.
(j) The operator shall not ride, or allow others to ride loads or the grapple.
(k) The operation of the lifter shall be observed before, during use, and during a shift. Any deficiency observed shall be examined by a designated person. If the deficiency constitutes a hazard, the lifter shall be removed from service and tagged “Out of Service.” Any indication of a hazardous condition shall be reported to a qualified person for evaluation.

20-5.4.5 Miscellaneous Operating Practices

(a) An operator shall not use a grapple that is tagged “Out of Service” or otherwise designated as nonfunctioning.
(b) “Out of Service” tags on grapples shall not be removed without the approval of the person placing them or a designated person.
(c) The grapple, when not in use, shall be stored.
(d) Caution should be taken that operating markings or tags shall not be removed or defaced. Missing or illegible markings or tags shall be replaced.

SECTION 20-5.5: INSTRUCTION MANUALS

Operating instructions and maintenance and parts information shall be furnished by the manufacturer.
