- Update your copy by inserting these revised pages.
- Keep the pages you remove for reference.
Preface

This is the first edition of ASME A112.19.5/CSA B45.15, Flush valves and spuds for water closets, urinals, and tanks.
This Standard replaces ASME A112.19.5-2005, Trim for Water-Closet Bowls, Tanks, and Urinals and the requirements in Clauses 4.18.1, 4.18.3, and 5.8.7 of CSA B125.3-11.
This Standard is considered suitable for use with conformity assessment within its stated scope.
This Standard was prepared by the ASME/CSA Joint Harmonization Task Group on Plumbing Fixtures, under the jurisdiction of the ASME Standards Committee on Plumbing Materials and Equipment and the CSA Technical Committee on Plumbing Fixtures. The CSA Technical Committee operates under the jurisdiction of the CSA Strategic Steering Committee on Water Management Products, Materials, and Systems. This Standard has been formally approved by the ASME Standards Committee and the CSA Technical Committee. This Standard was approved as an American National Standard by the American National Standards Institute on September 1, 2011.

October 2011

ASME Notes:
(1) This standard was developed under procedures accredited as meeting the criteria for American National Standards and it is an American National Standard. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed Standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.
(2) ASME does not “approve,” “rate,” or “endorse” any item, construction, proprietary device, or activity.
(3) ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assume any such liability. Users of a standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.
(4) Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this standard.
(5) ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.
(6) ASME issues written replies to inquiries concerning interpretation of technical aspects of this Standard. All inquiries regarding this Standard, including requests for interpretations, should be addressed to:
Secretary, A112 Standards Committee
The American Society of Mechanical Engineers
Three Park Avenue
New York, NY 10016-5990
A request for interpretation should be clear and unambiguous. The request should
- cite the applicable edition of the Standard for which the interpretation is being requested.
- phrase the question as a request for an interpretation of a specific requirement suitable for general understanding and use, not as a request for an approval of a proprietary design or situation. The inquirer may also include any plans or drawings, which are necessary to explain the question; however, they should not contain proprietary names or information.
ASME procedures provide for reconsideration of any interpretation when or if additional information that might affect an interpretation is available. Further, persons aggrieved by an interpretation may appeal to the cognizant ASME Committee.
Interpretations are published on the ASME Web site under the Committee Pages at http://cstools.asme.org/ as they are issued.
CSA Notes:
(1) Use of the singular does not exclude the plural (and vice versa) when the sense allows.
(2) Although the intended primary application of this Standard is stated in its Scope, it is important to note that it remains the responsibility of the users of the Standard to judge its suitability for their particular purpose.
(3) This publication was developed by consensus, which is defined by CSA Policy governing standardization — Code of good practice for standardization as “substantial agreement. Consensus implies much more than a simple majority, but not necessarily unanimity”. It is consistent with this definition that a member may be included in the Technical Committee list and yet not be in full agreement with all clauses of this publication.
(4) To submit a request for interpretation of CSA Standards, please send the following information to inquiries@csa.ca and include “Request for interpretation” in the subject line:
   (a) define the problem, making reference to the specific clause, and, where appropriate, include an illustrative sketch;
   (b) provide an explanation of circumstances surrounding the actual field condition; and
   (c) where possible, phrase the request in such a way that a specific “yes” or “no” answer will address the issue.
   Committee interpretations are processed in accordance with the CSA Directives and guidelines governing standardization and are published in CSA’s periodical Info Update, which is available on the CSA website at http://standardsactivities.csa.ca.
(5) CSA Standards are subject to periodic review, and suggestions for their improvement will be referred to the appropriate committee. To submit a proposal for change to CSA Standards, please send the following information to inquiries@csa.ca and include “Proposal for change” in the subject line:
   (a) Standard designation (number);
   (b) relevant clause, table, and/or figure number;
   (c) wording of the proposed change; and
   (d) rationale for the change.
(6) Attention is drawn to the possibility that some of the elements of this Standard may be the subject of patent rights. CSA is not to be held responsible for identifying any or all such patent rights. Users of this Standard are expressly advised that determination of the validity of any such patent rights is entirely their own responsibility.
1 Scope

1.1 This Standard covers spuds and flush valves for water closet bowls, tanks, and urinals.

1.2 In this Standard, “shall” is used to express a requirement, i.e., a provision that the user is obliged to satisfy in order to comply with the standard; “should” is used to express a recommendation or that which is advised but not required; and “may” is used to express an option or that which is permissible within the limits of the standard.

Notes accompanying clauses do not include requirements or alternative requirements; the purpose of a note accompanying a clause is to separate from the text explanatory or informative material.

Notes to tables and figures are considered part of the table or figure and may be written as requirements.

Annexes are designated normative (mandatory) or informative (nonmandatory) to define their application.

1.3 SI units are the units of record in Canada. In this Standard, the inch/pound units are shown in parentheses.

The values stated in each measurement system are equivalent in application; however, each system is to be used independently. Combining values from the two measurement systems can result in non-conformance with this Standard.

All references to gallons are to U.S. gallons.

For information on the conversion criteria used in this Standard, see Annex A.

2 Reference publications

This Standard refers to the following publications, and where such reference is made, it shall be to the edition listed below, including all amendments published thereto.

ASME/CSA (The American Society of Mechanical Engineers/Canadian Standards Association)
ASME A112.19.2-2008/CSA B45.1-08
Ceramic plumbing fixtures

ASME (The American Society of Mechanical Engineers)
B1.20.1-1983 (R2006)
Pipe Threads, General Purpose, Inch

CSA (Canadian Standards Association)
B125.3-11
Plumbing fittings
3 Definitions and abbreviations

3.1 Definitions
The following definitions shall apply in this Standard:

Flush valve — a valve located in a flush tank and used to flush a fixture by discharging water into the fixture.

   Early closure flush valve — a valve in which the flush valve seal is adjustable to control the water level.
   Note: Usually, early closure flush valves are dependent on either a time delay or the distance that the water level drops to control the level at which the flush valve closes.

Flush valve body — a fitting that contains a flush valve seat and a means of mounting to a fixture
Note: The means for mounting the body can be threaded or non-threaded, and can be with or without an overflow.

Flush valve seal — a component of the flush valve that mates against the flush valve seat to prevent leakage when the flush valve is closed.
Note: Flappers are a type of flush valve seal.

Flush valve seat — the sealing surface of the flush valve body which, when mated with the flush valve seal, prevents leakage through the flush valve into the fixture.

Mounting seal — a seal between the flush valve body and the fixture.

Spud — a fitting used to connect a flushometer valve to a water closet or urinal.
Note: Spuds are illustrated in Tables 1 and 2.

3.2 Abbreviations
The following abbreviations shall apply in this Standard:

NPS — nominal pipe size
NPSM — National Pipe Straight Mechanical
PVC — polyvinylchloride

4 Design requirements

4.1 Rated temperatures
Flush valves and spuds shall be designed for rated supply temperatures between 5 and 43 °C (40 and 110°F).

4.2 Threads
Pipe threads shall comply with ASME B1.20.1.

4.3 Overflow tubes
The inside diameter of the overflow tube for flush valves intended to be sold as replacement parts shall be a minimum of 23.4 mm (0.92 in).

4.4 Spud dimensions
Threaded spuds shall comply with the dimensions specified in Tables 1 and 2.
